Therapeutic Goal in TGA, VSD and LVOTO.

- Biventricular repair..
- Systemic Left Ventricle.
- Low early M/M.
- Low late M/M
- Low reintervention rate.

Anatomy

- Multi Level LVOTO.
- Pulmonary Valve. (annulus and bicuspid)
- Sub pulmonary
 - Posterior deviation of Conal Septum
 - Abnormal Mitral valve attachments.
 - Cleft Mitral Valve.

What are we doing

- Palliation with BT shunt vs early correction.
 - Progression of LVOTO.
- Neonatal Rastelli, Switch or Nikaidoh.
- Infant/toddler Rastelli with homografts. (Eur J Cardiothorac Surg. 2010 Dec;38(6):699-706)
- Low early mortality.
- High late morbidity
 - RVOTO Reintervention.
 - LVOTO Reoperation.
 - Arrhythmias
 - LV failure.
- Late mortality even worse than atrial switch.

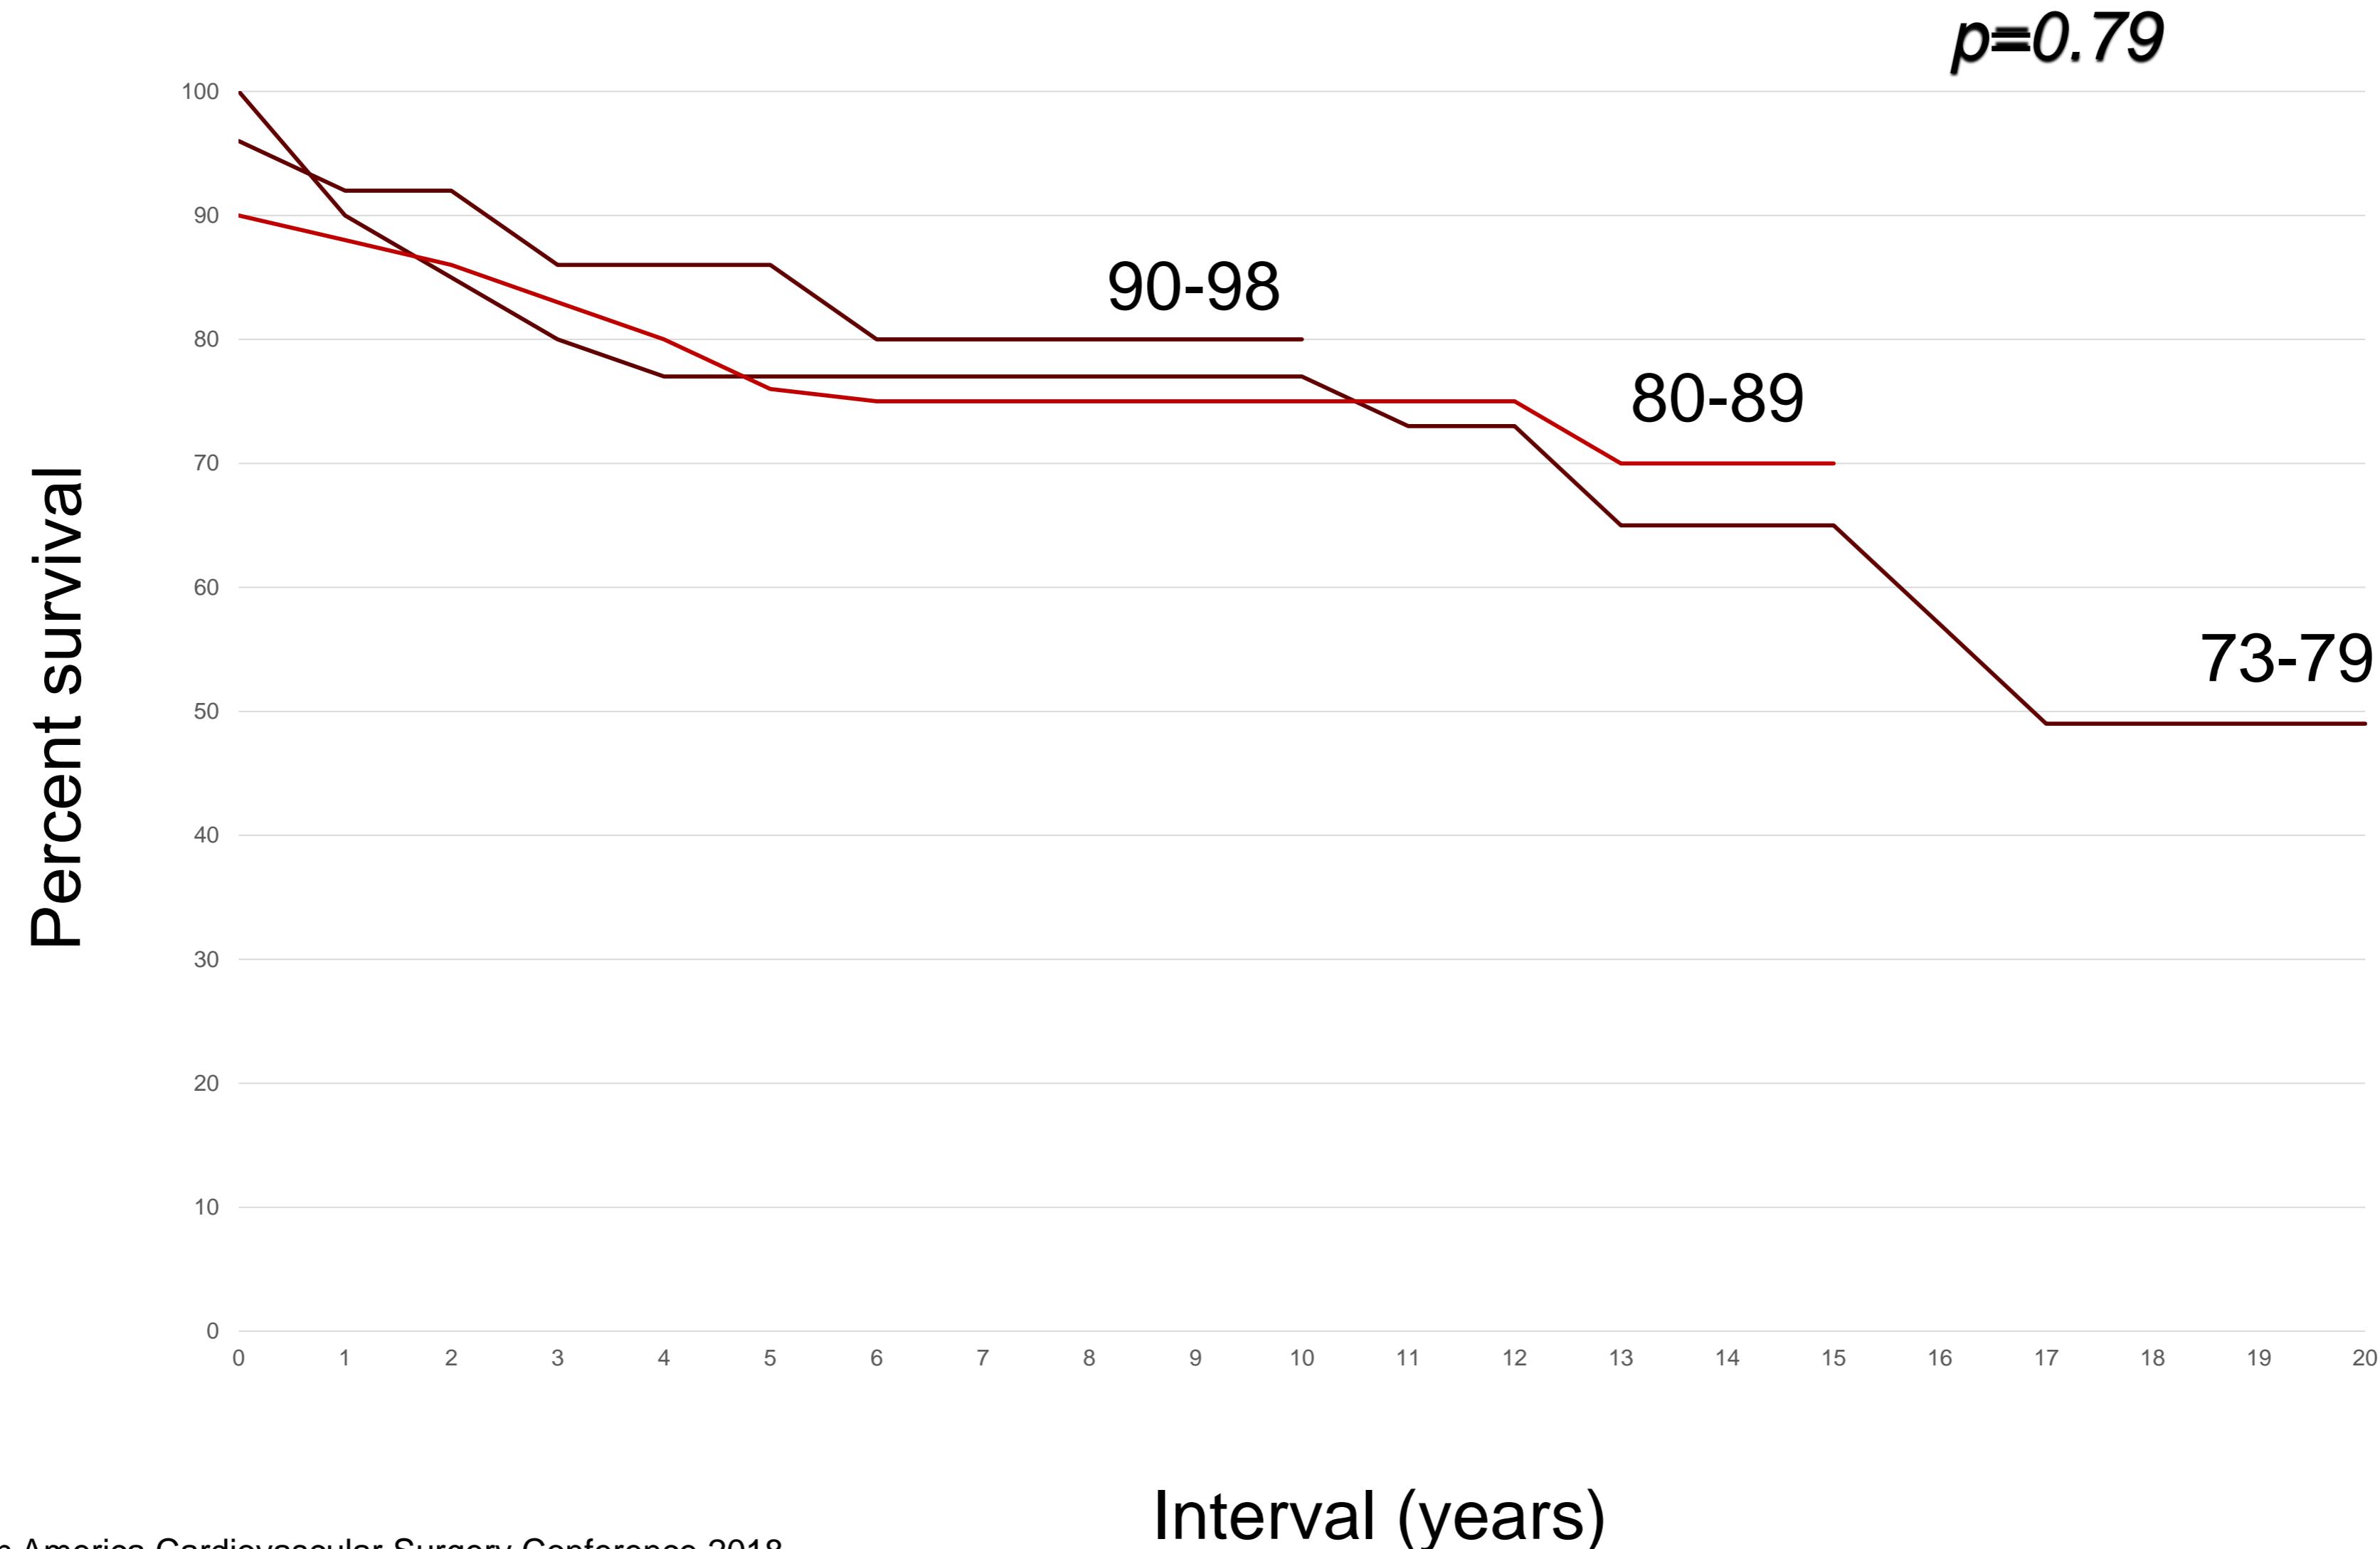

Mayo Clinic Study

- Rastelli for TGA: 231 pts. (7/68-1/00)
- Early mortality: 10 %.
- Late Survival: 48 % at 20 yrs.
- Freedom from reintervention: 18 % at 20 yrs.
- Causes of late death: Arrhythmia and LV fail.

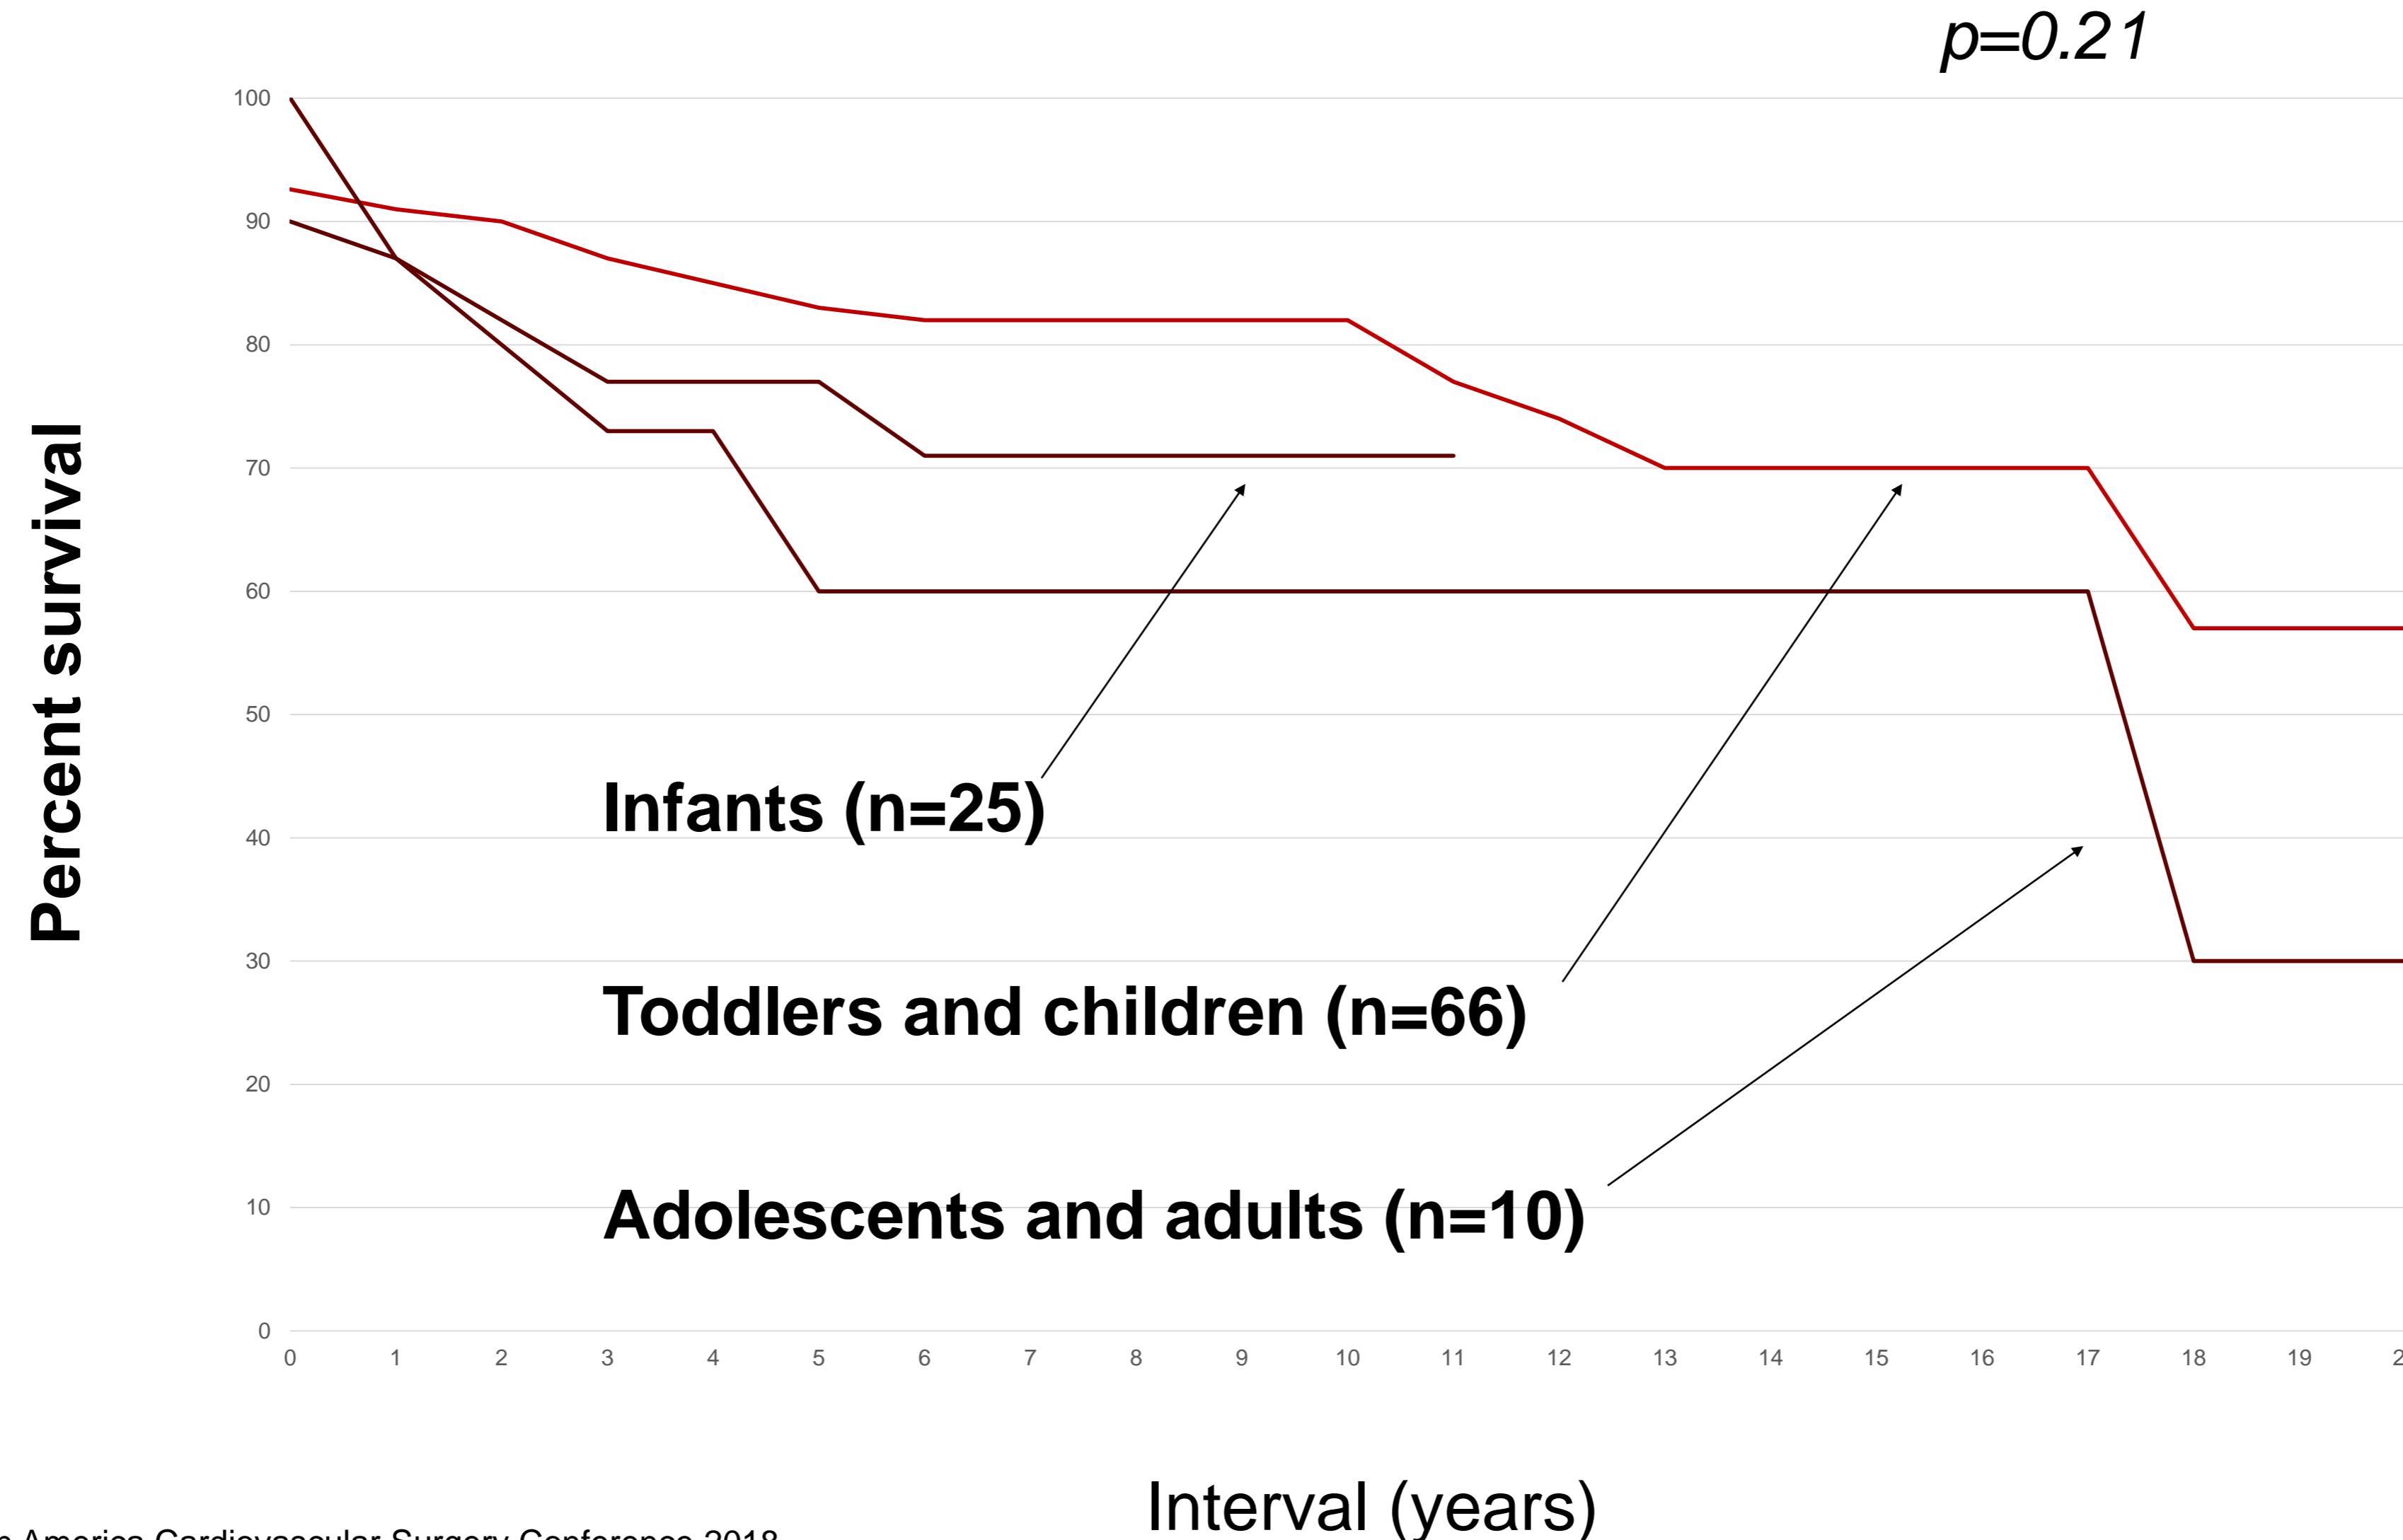

Boston Children's Study

- Rastelli for TGA: 101 pts. (7/73-4/98)
- Early mortality: 7 %.
- Late Survival: 49 % at 20 yrs.
- Freedom from reintervention: 18 % at 20 yrs.
- Causes of late death: Arrhythmia and LV fail.

Survival

Survival

Late failure

- 17 deaths and 1 HTX.
- LV failure= 7, sudden death=5
- Significant predictors

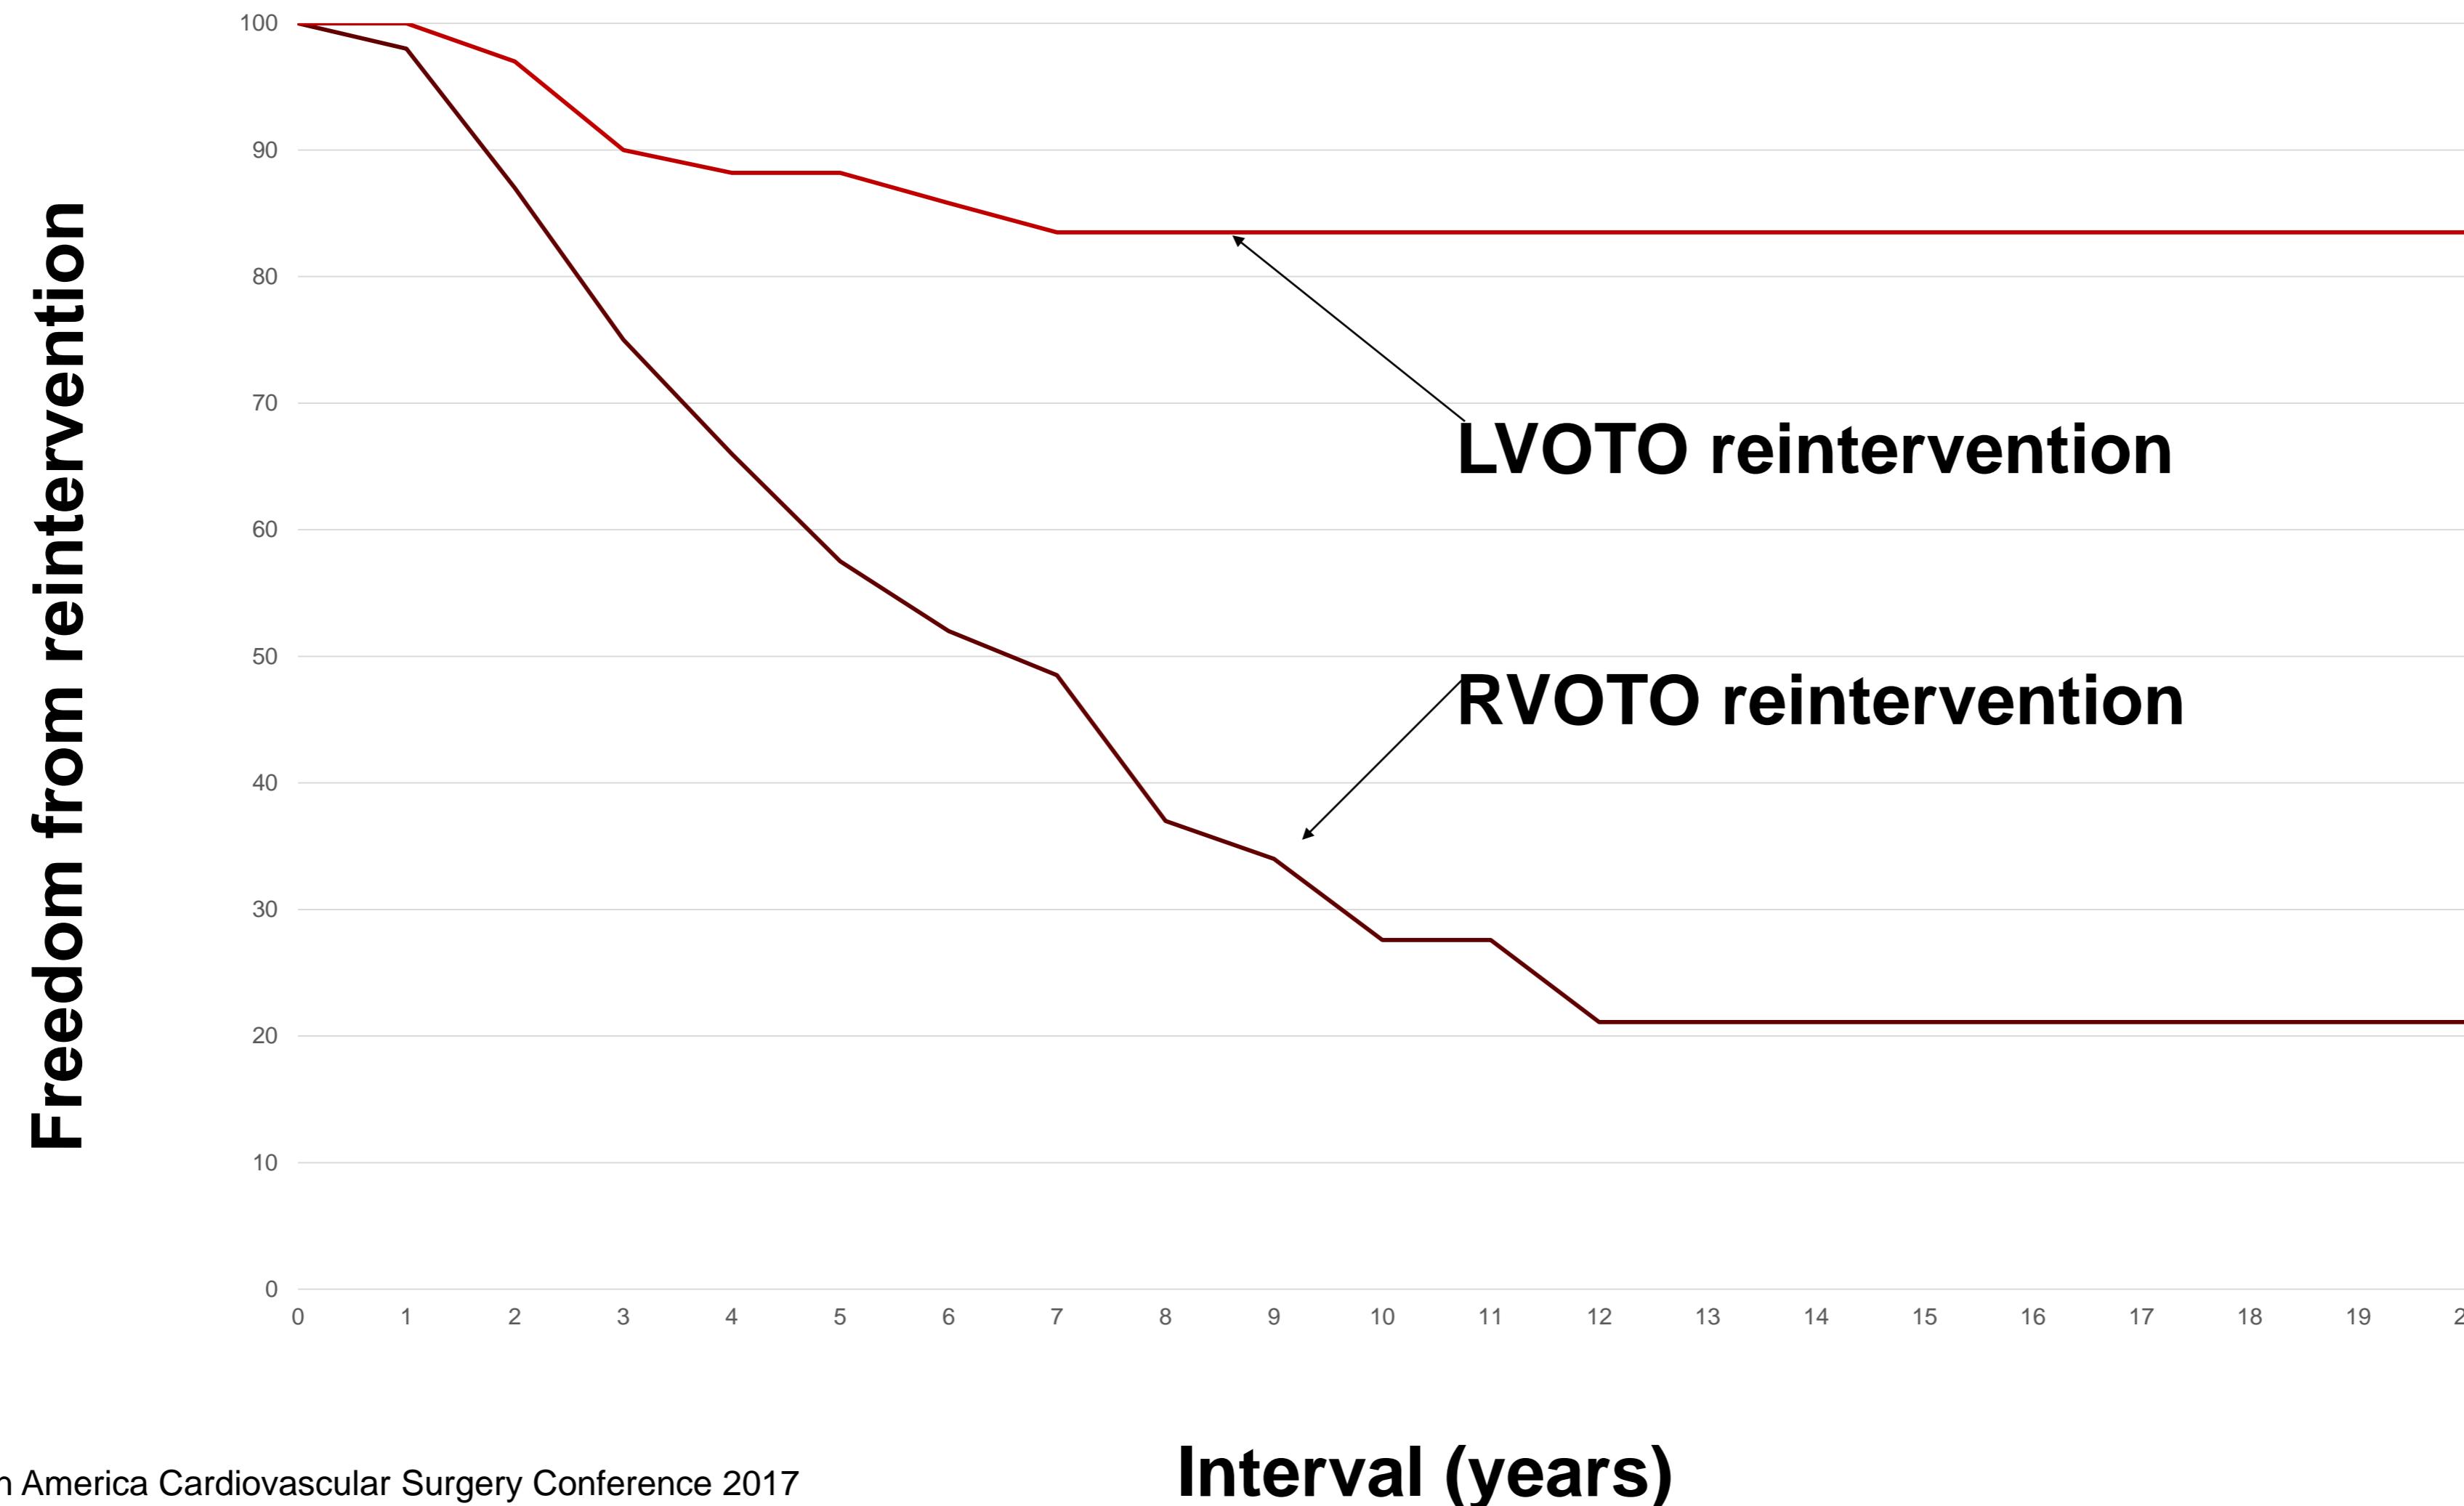

Straddling TV $p=0.0002$

Dacron Cdt. $p=0.009$

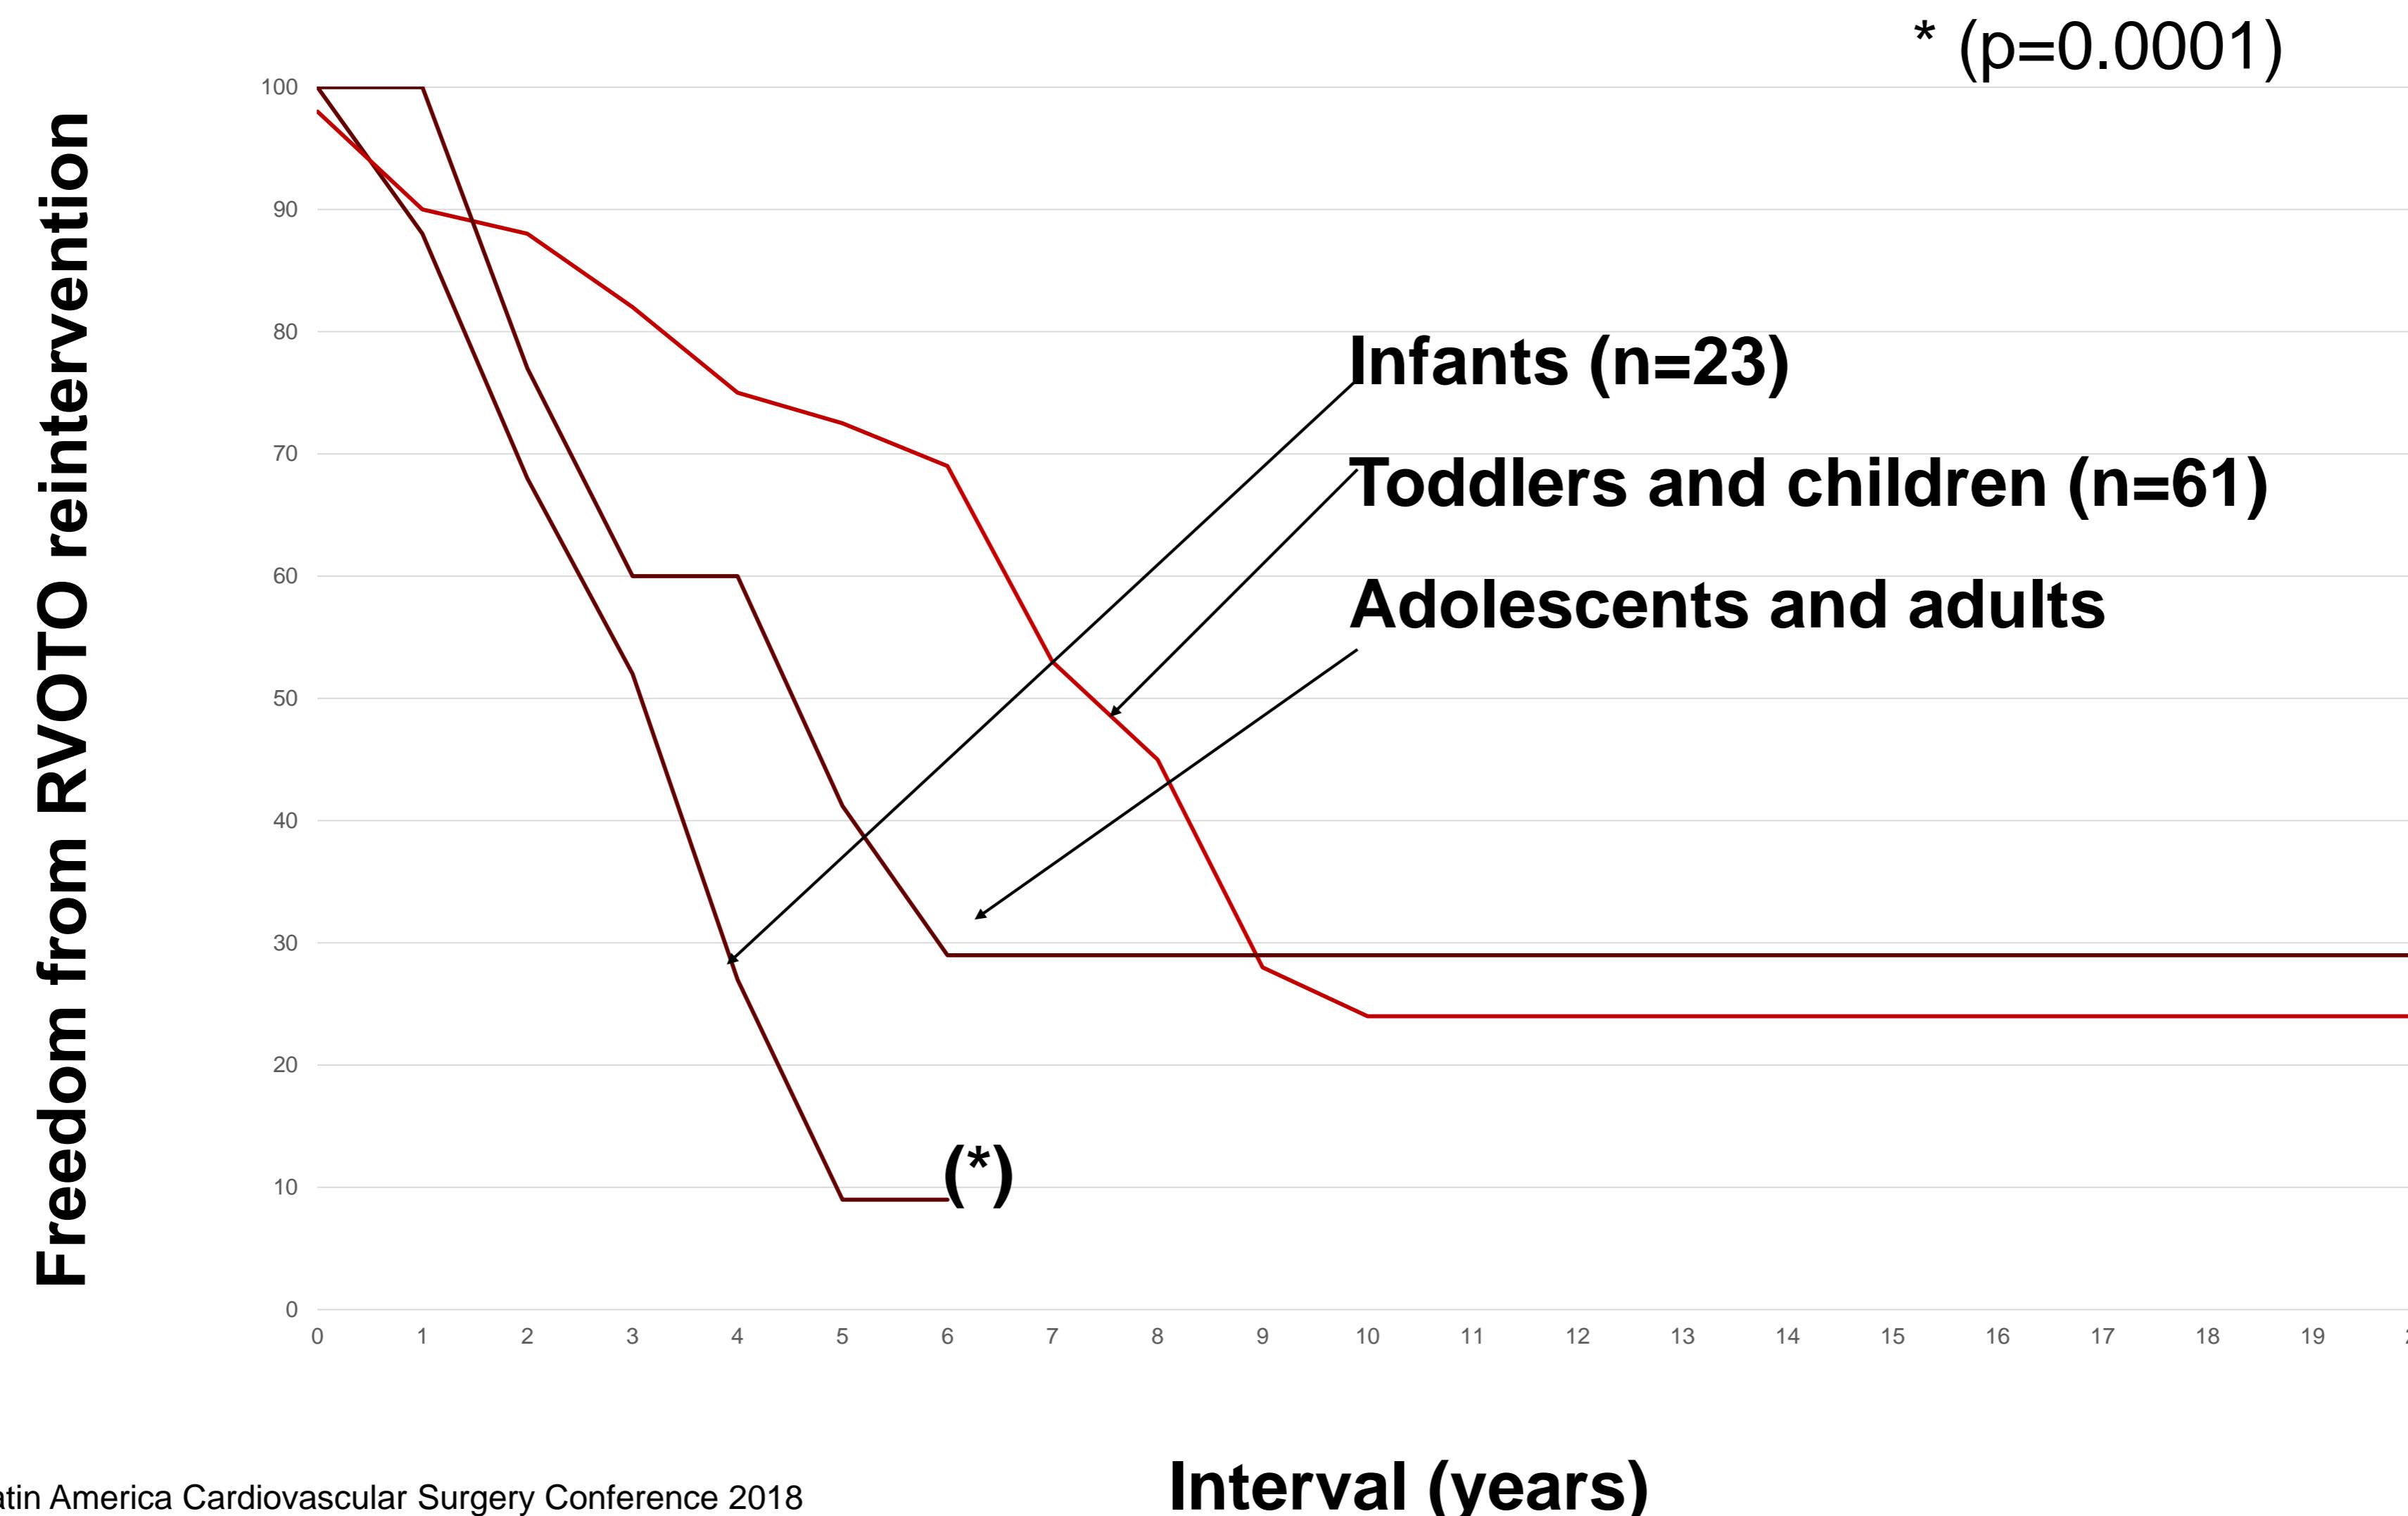

longer LOS $p=0.03$

C-Ed. Conduits $p=0.05$

Freedom from reintervention

Freedom from RVOTO reintervention

Risk factors for reinterventions

- LVOTO reintervention= 17 % /15 yrs.

No VSD enlargement $p=0.02$

Longer CPB time $p=0.02$

LOS ≥ 14 d $p=0.04$

- RVOTO reintervention= 79 % /15 yrs.

Surgeon X $p=0.001$

Rt sided cdt. $p=0.02$

Infants $p=0.0001$

Weight < 9 Kg $p=0.02$

Male gender $p=0.05$

“Kreutzer's article illustrates the results of the perfect observance of surgical orthodoxy. In view of the long-term results, I wonder whether this observance is still justified?”

Yves Lecompte, JTCVS, January 2002

TGA, VSD, LVOTO ¿Why Rastelli's fail in the long term?

- LVOTO and LV. Failure Graham T. et al. J.Thorac & CV. Surg 1987;93:775-84. Palik I. Et al. Am. Heart J. 1986; 112: 1271-8)
 - Arrhythmia and sudden death.
 - Reoperation. (Aorta or conduit behind the sternum)
¿Lessons Learnt? (Univ Indiana, Brown J, WJPCHS, in press)
Ann Thorac Surg. 2009 Jul;88(1):137-42; Al Halees.
 - Always enlarge the VSD and resect conal septum.
 - Avoid Rastellis in non committed VSD.
 - Avoid Rastellis in mild LVOTO. (Circulation. 2009 15;120(11 Suppl):S53-8) Emani R.
 - “The bigger the pulmonary annulus the more tortuous the LVOT will be after Rastelli”
 - Achieve pulmonary competence with PVR.
 - Surgical.
 - Interventional.

So, what Now?

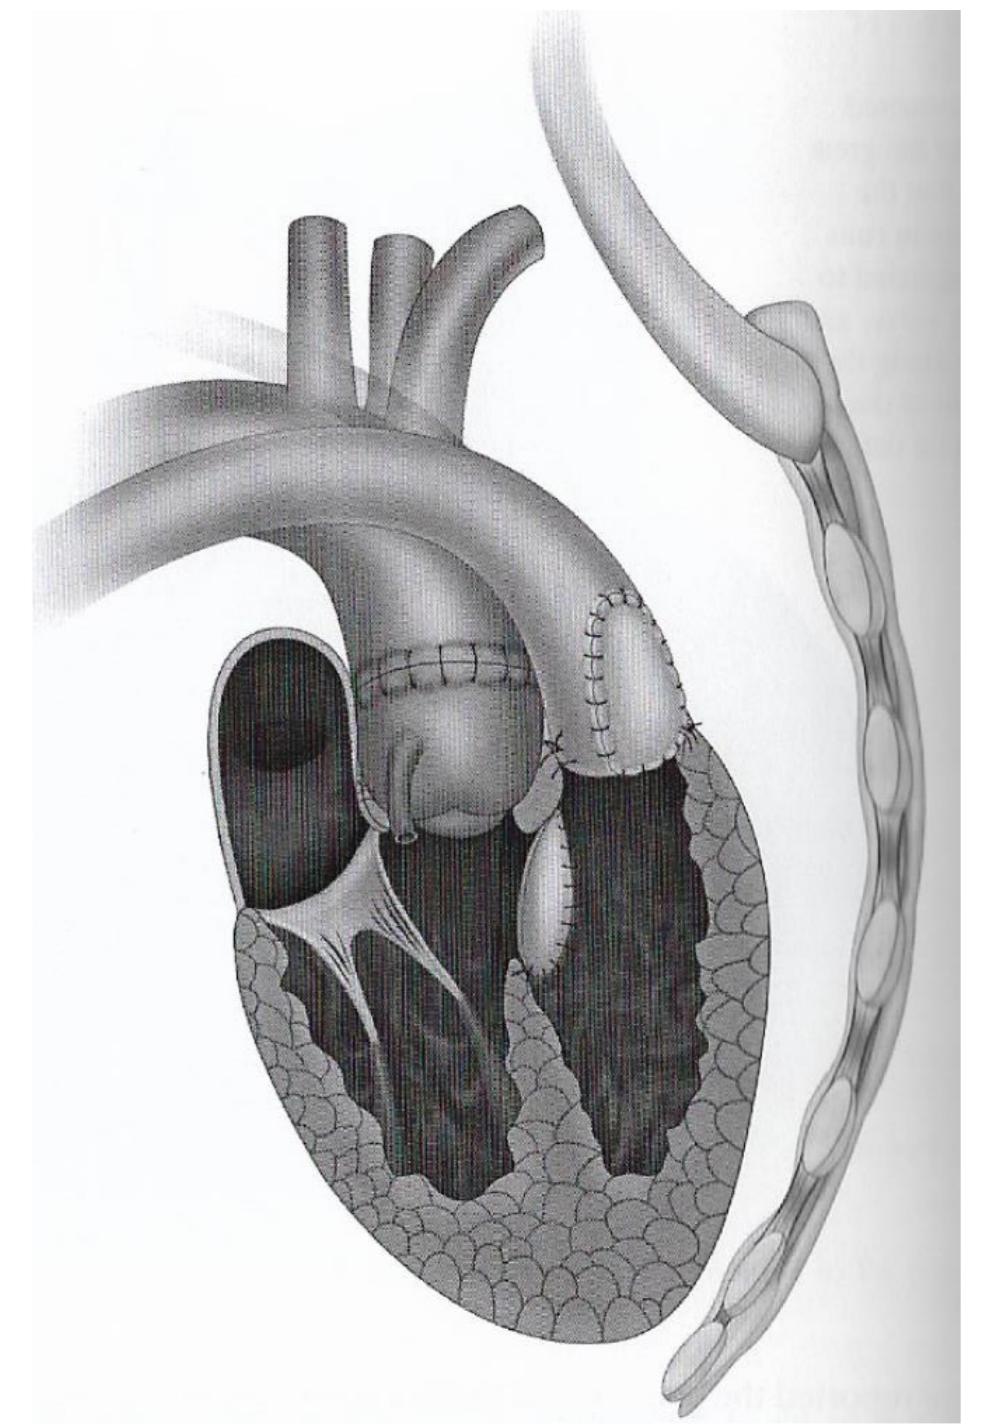

- Modification of the RVOT reconstruction in Rastelli:
 - Non Homograft Rastelli: APVC, Contegra, Cor Matrix.
- Explore other alternatives:
 - Arterial switch operation and resection.
 - Nikaidoh or “Ross Konno Arterial switch”.
 - REV.
 - One and a Half ventricle repair.
 - Univentricular repair.

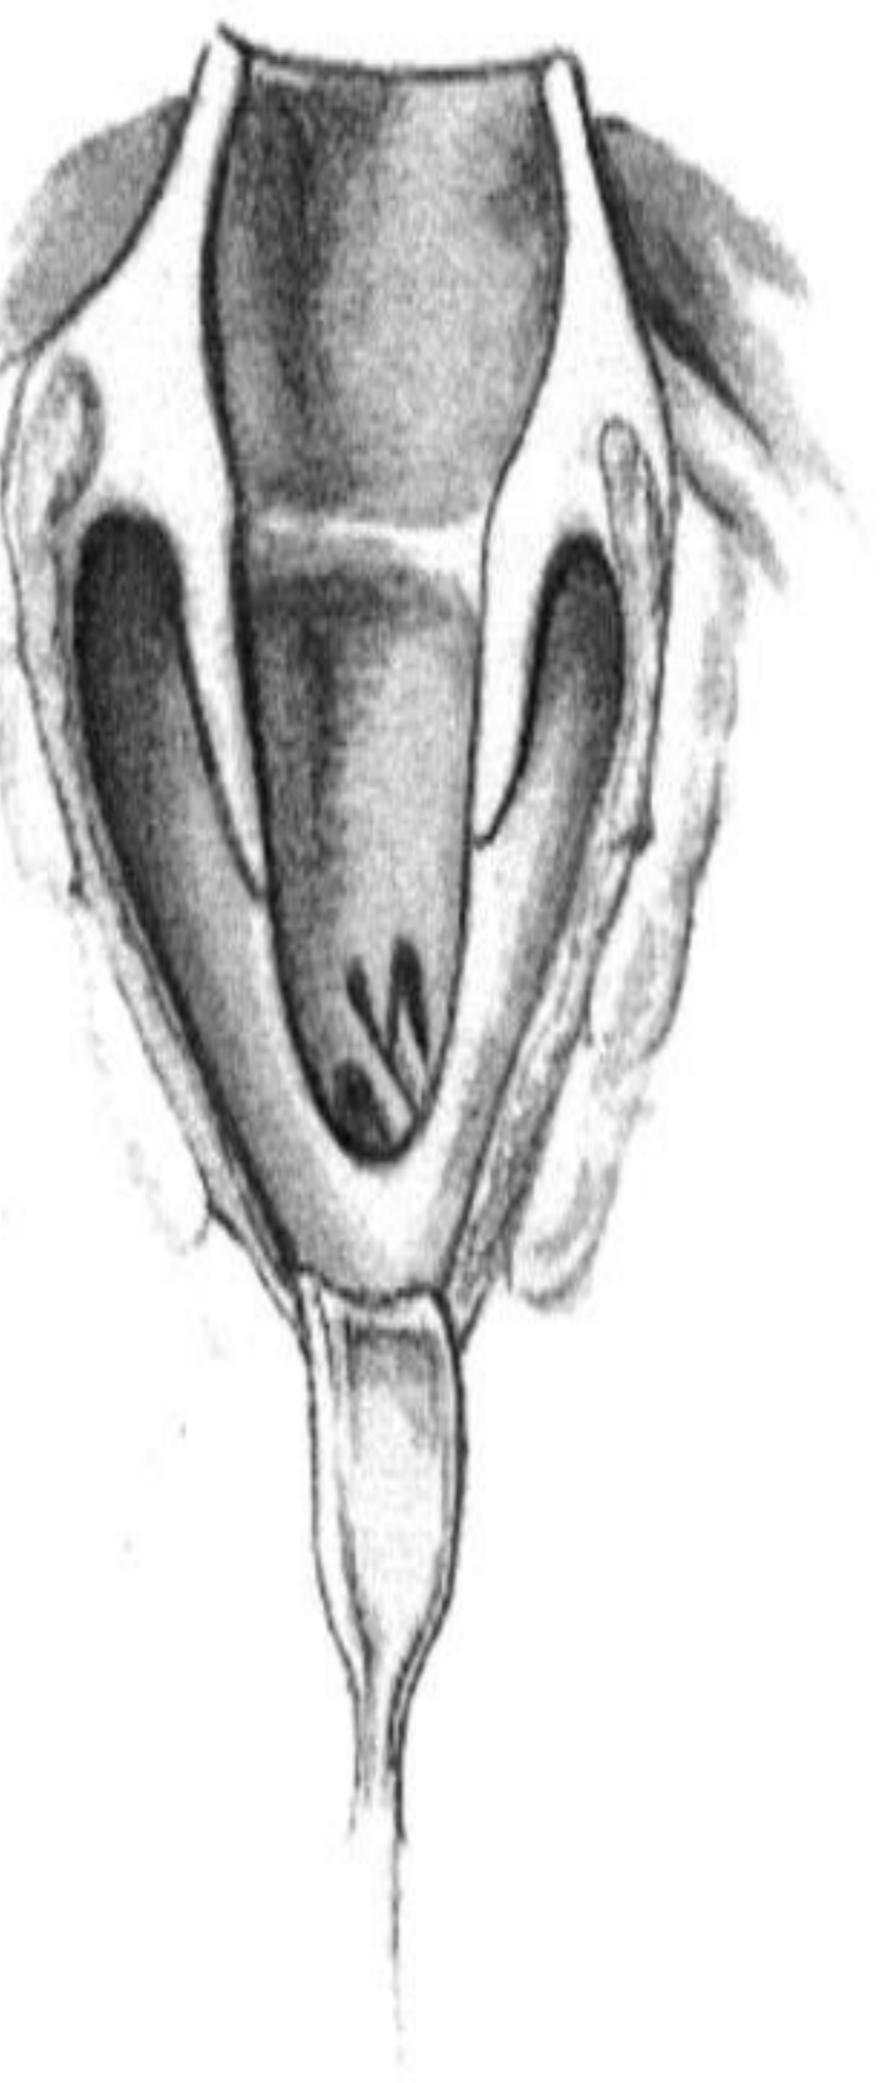

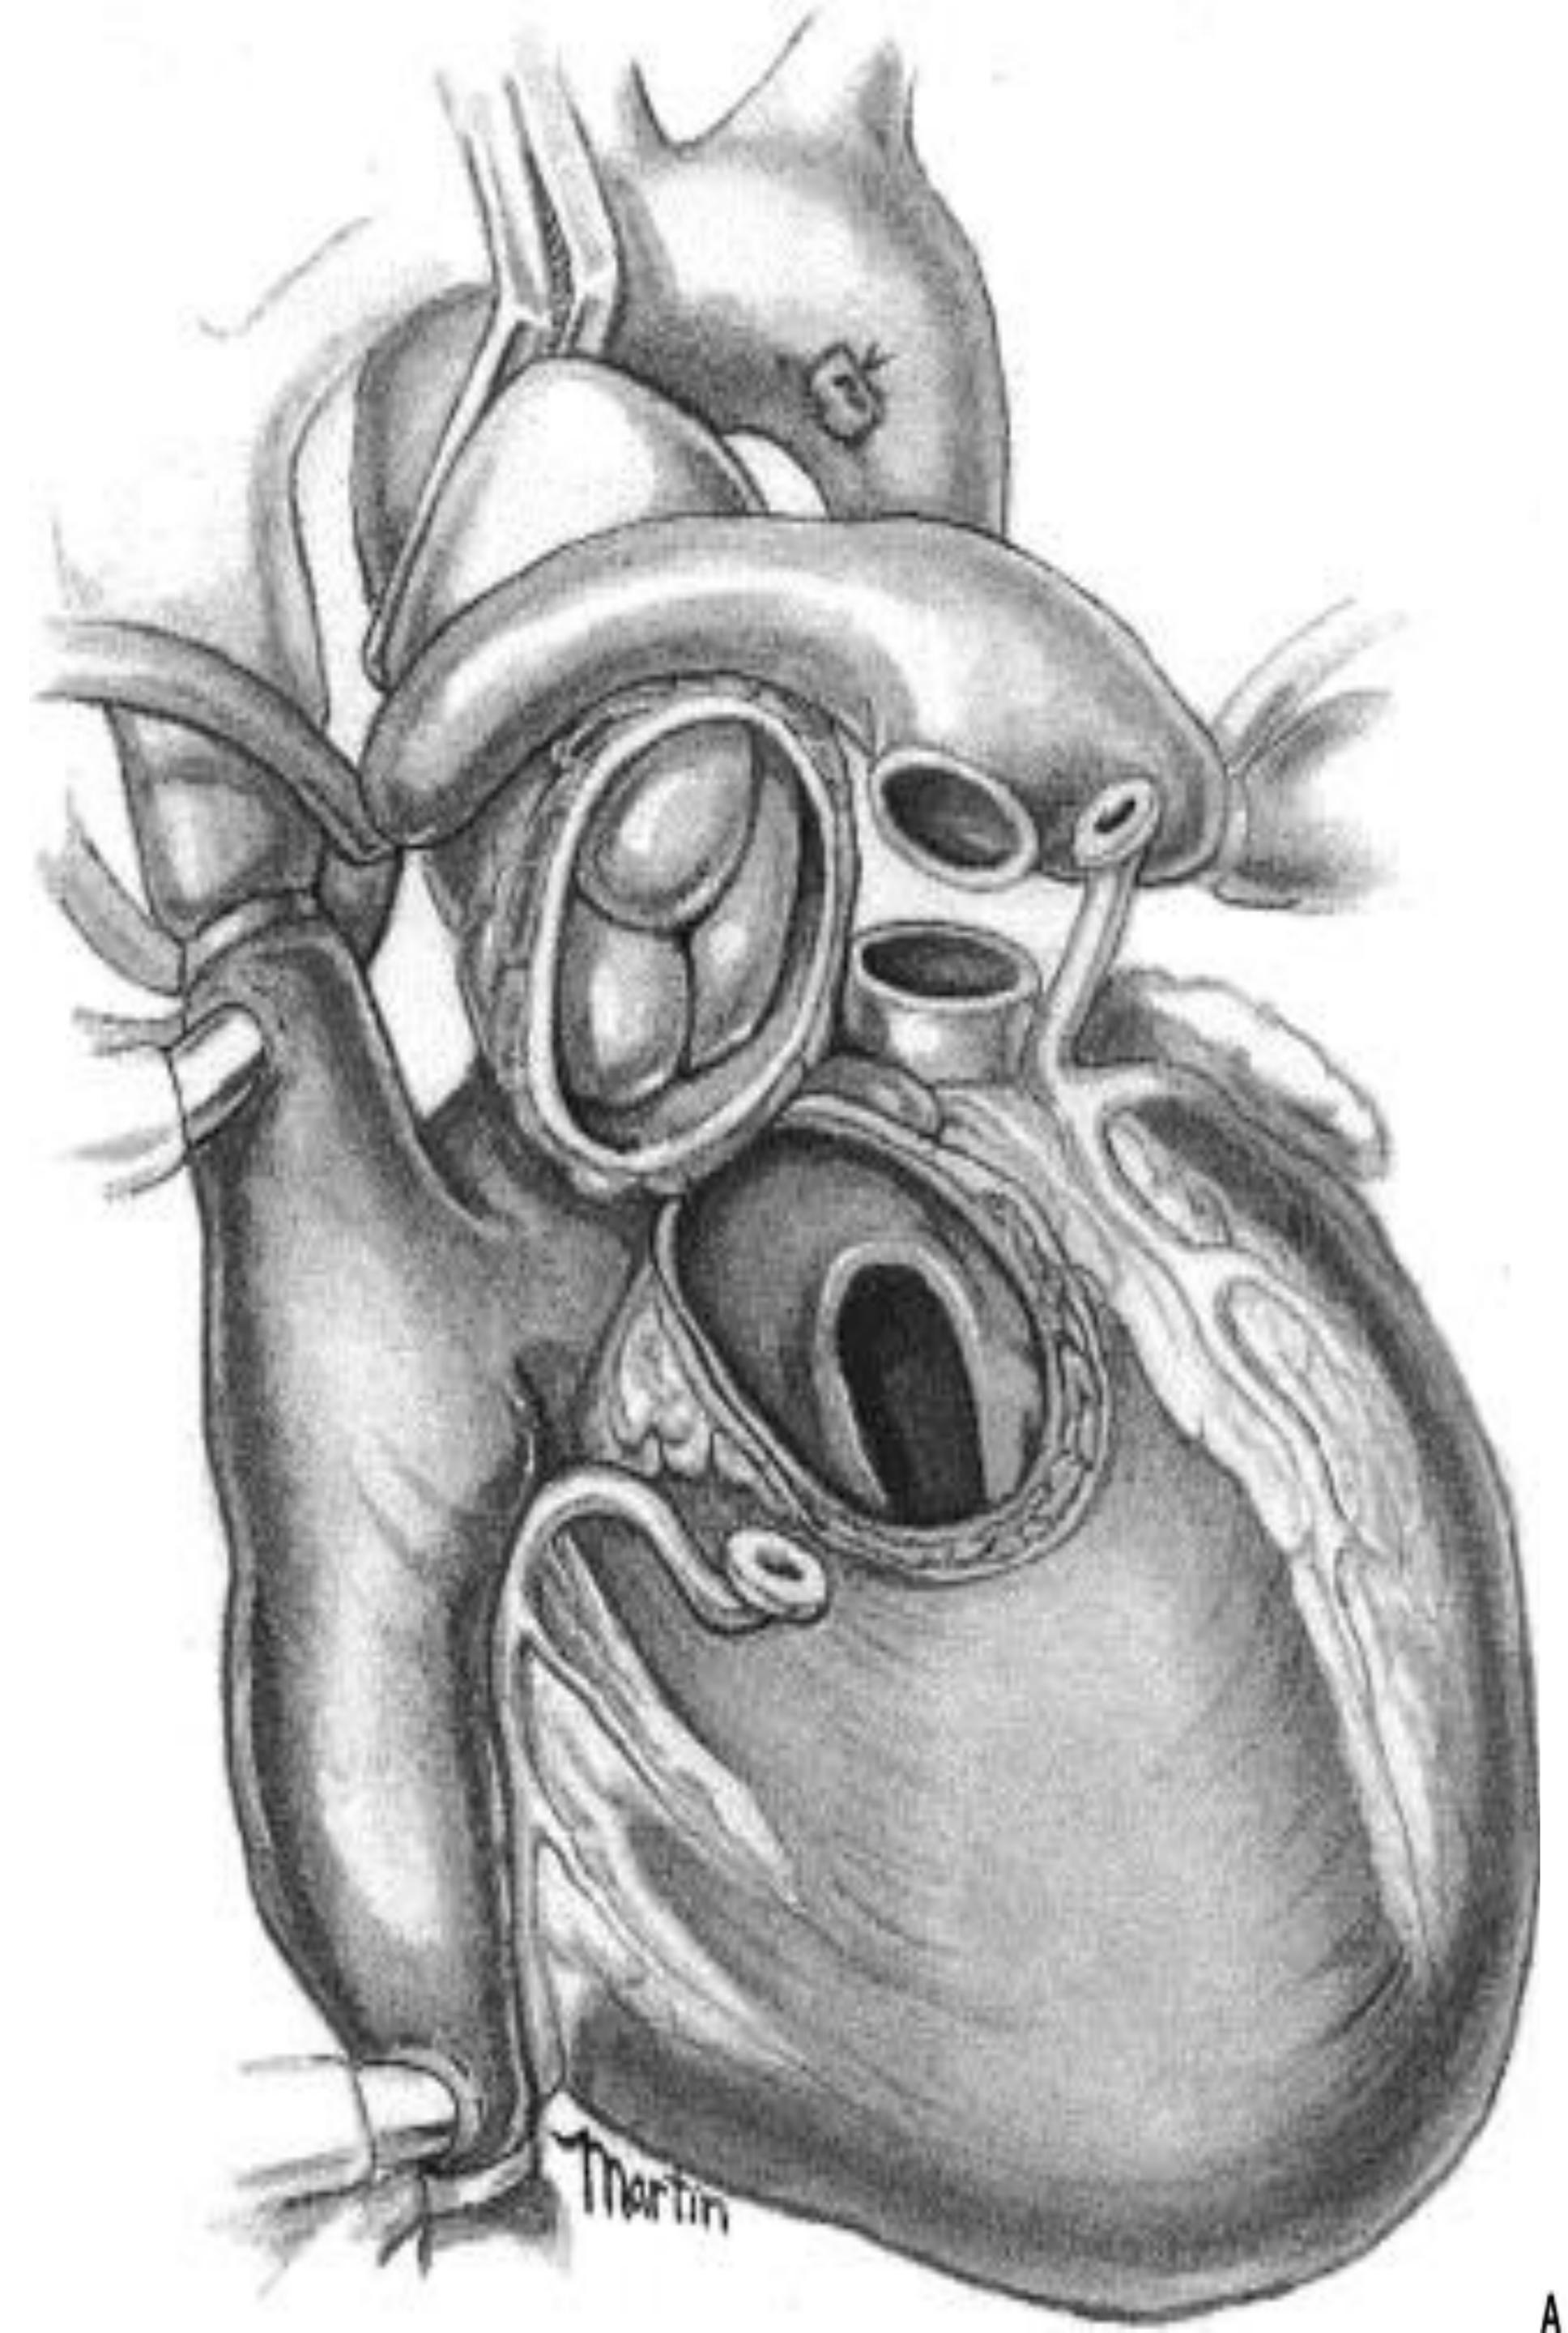

Arterial Switch

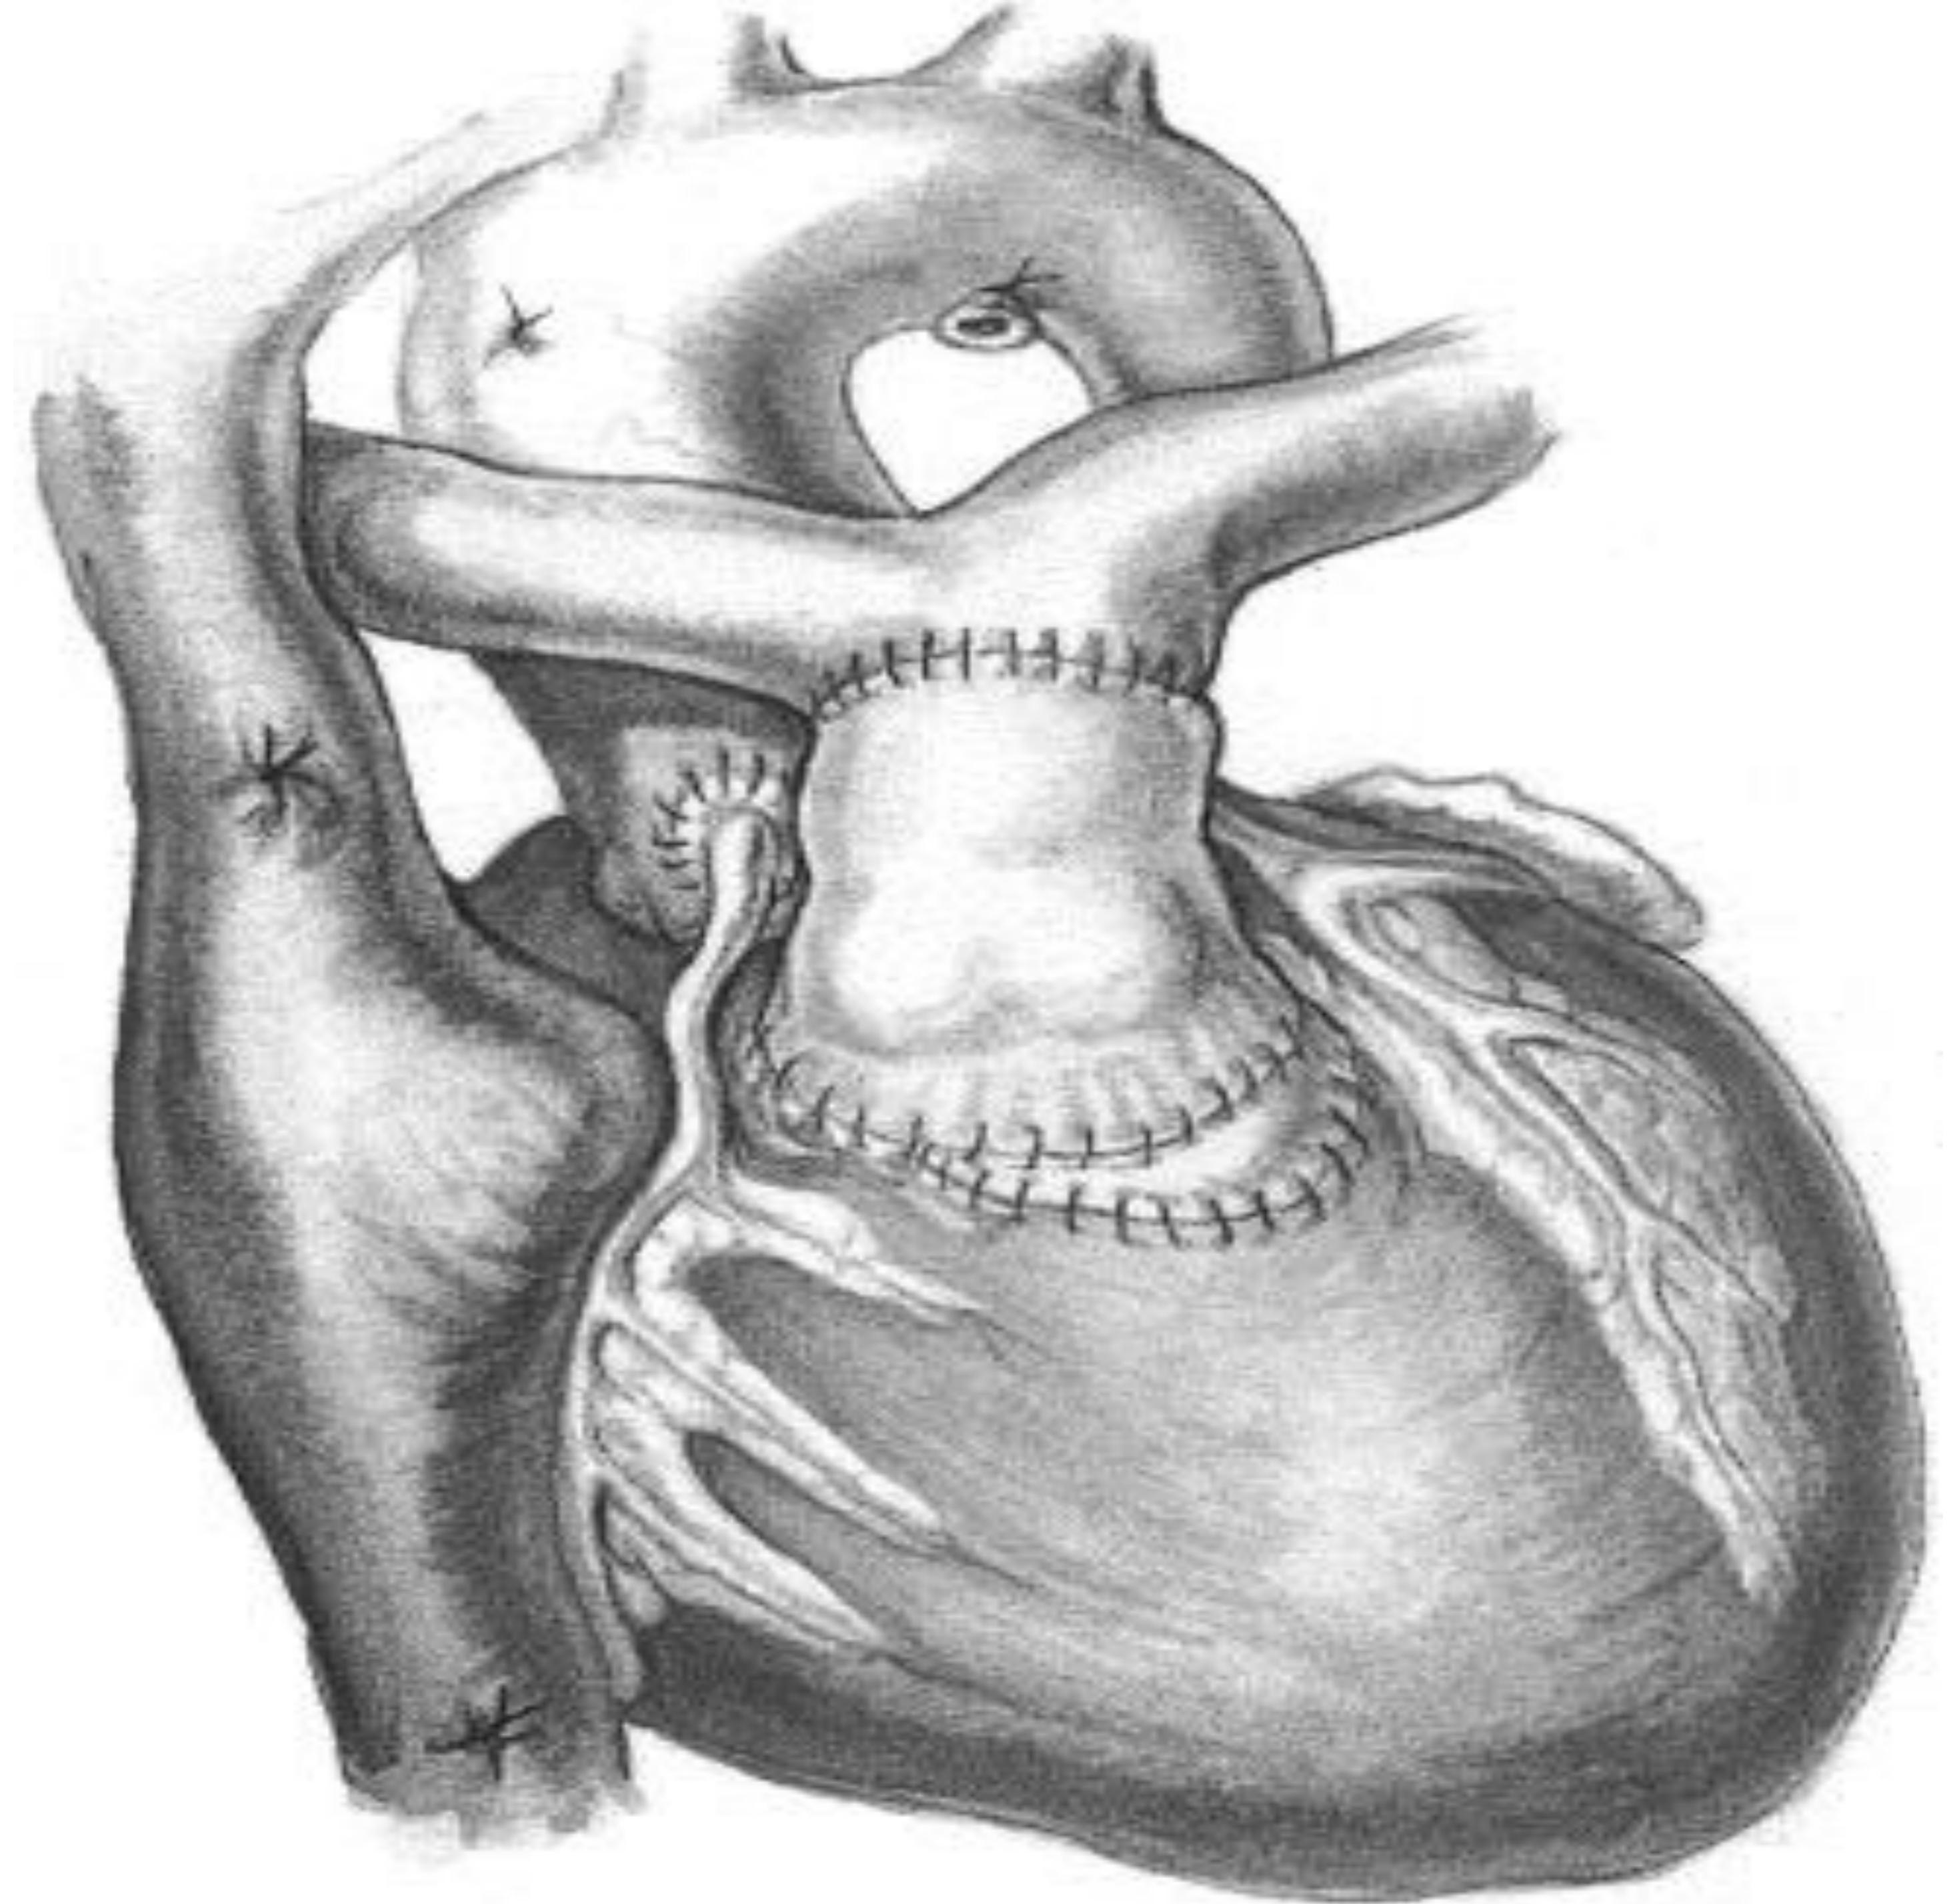

- The best option when possible.
 - Do not delay the repair!! (Circulation. 2009 15;120(11 Suppl):S53-8) Emani R
 - Mild Hypoplastic pulmonary annulus. (z -2)
 - Mild Dysplasia. At least bicuspid PV.
 - Complete resection of conal septum.
 - Traction stitches
 - VSD closure.
 - ASO without Ao P miss match.

Nikaidoh or Ross Konno Switch

- Aortic translocation and Reimplantation in the LVOT.
- With coronary reimplantation.
- Ideally for mild mod PV Hypoplasia or dysplastic PV
- Appropriate when VSD is not committed.
 - No baffle, RV volume not affected.
- Use of Lecompte Manouver and RV PA conduit.
- Sternal compression is diminished.
- Technical difficulty, late AI. Morrel V, Surgery of Conotruncal Anomalies

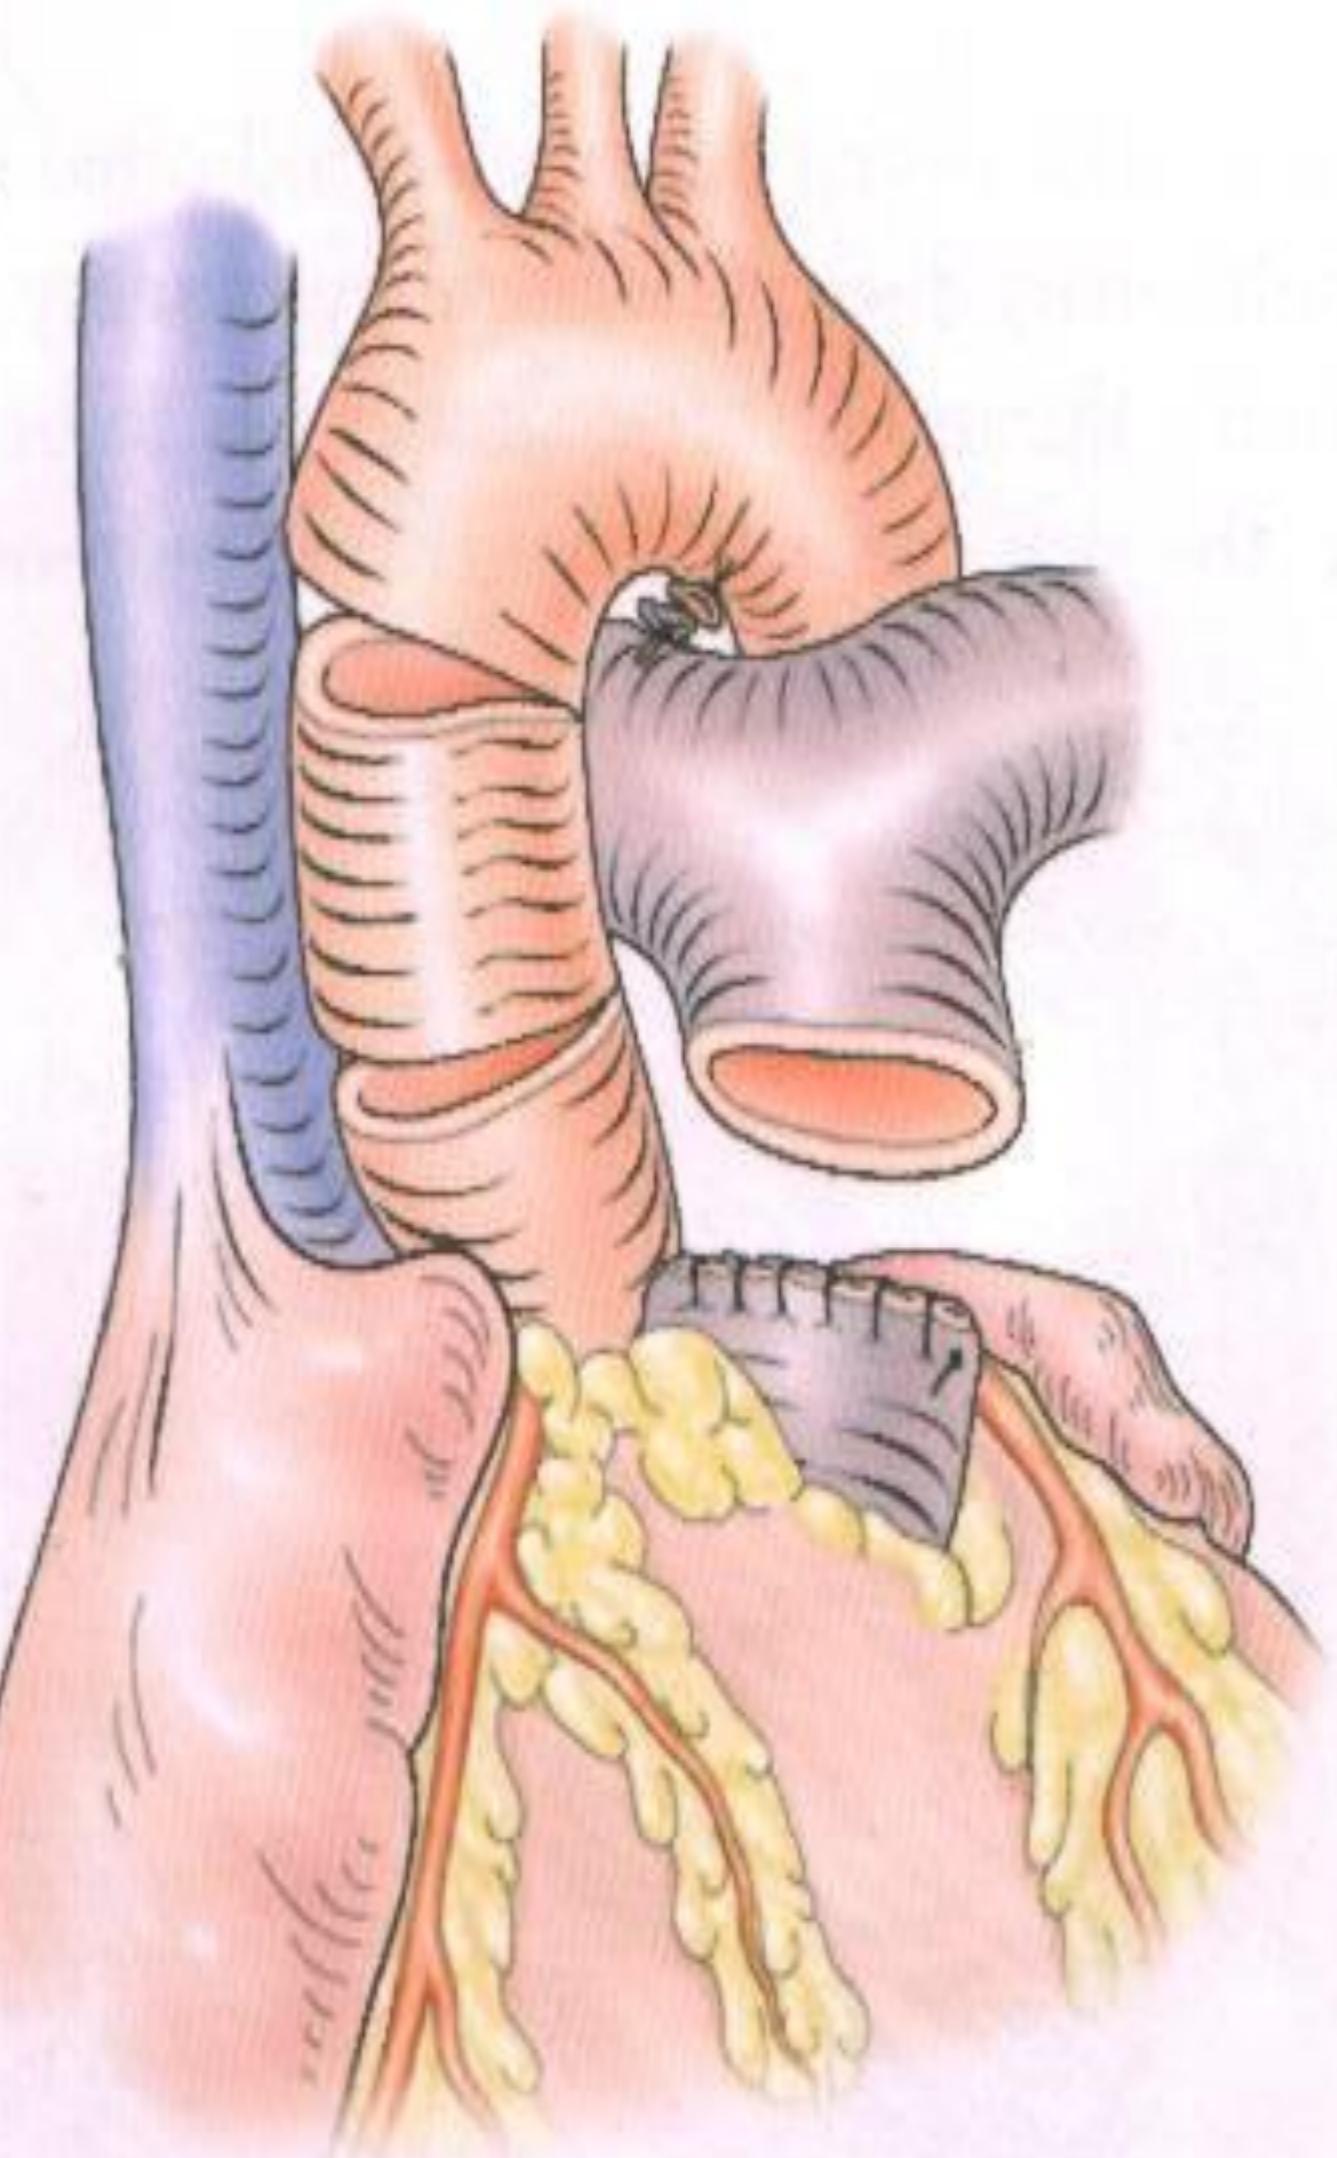

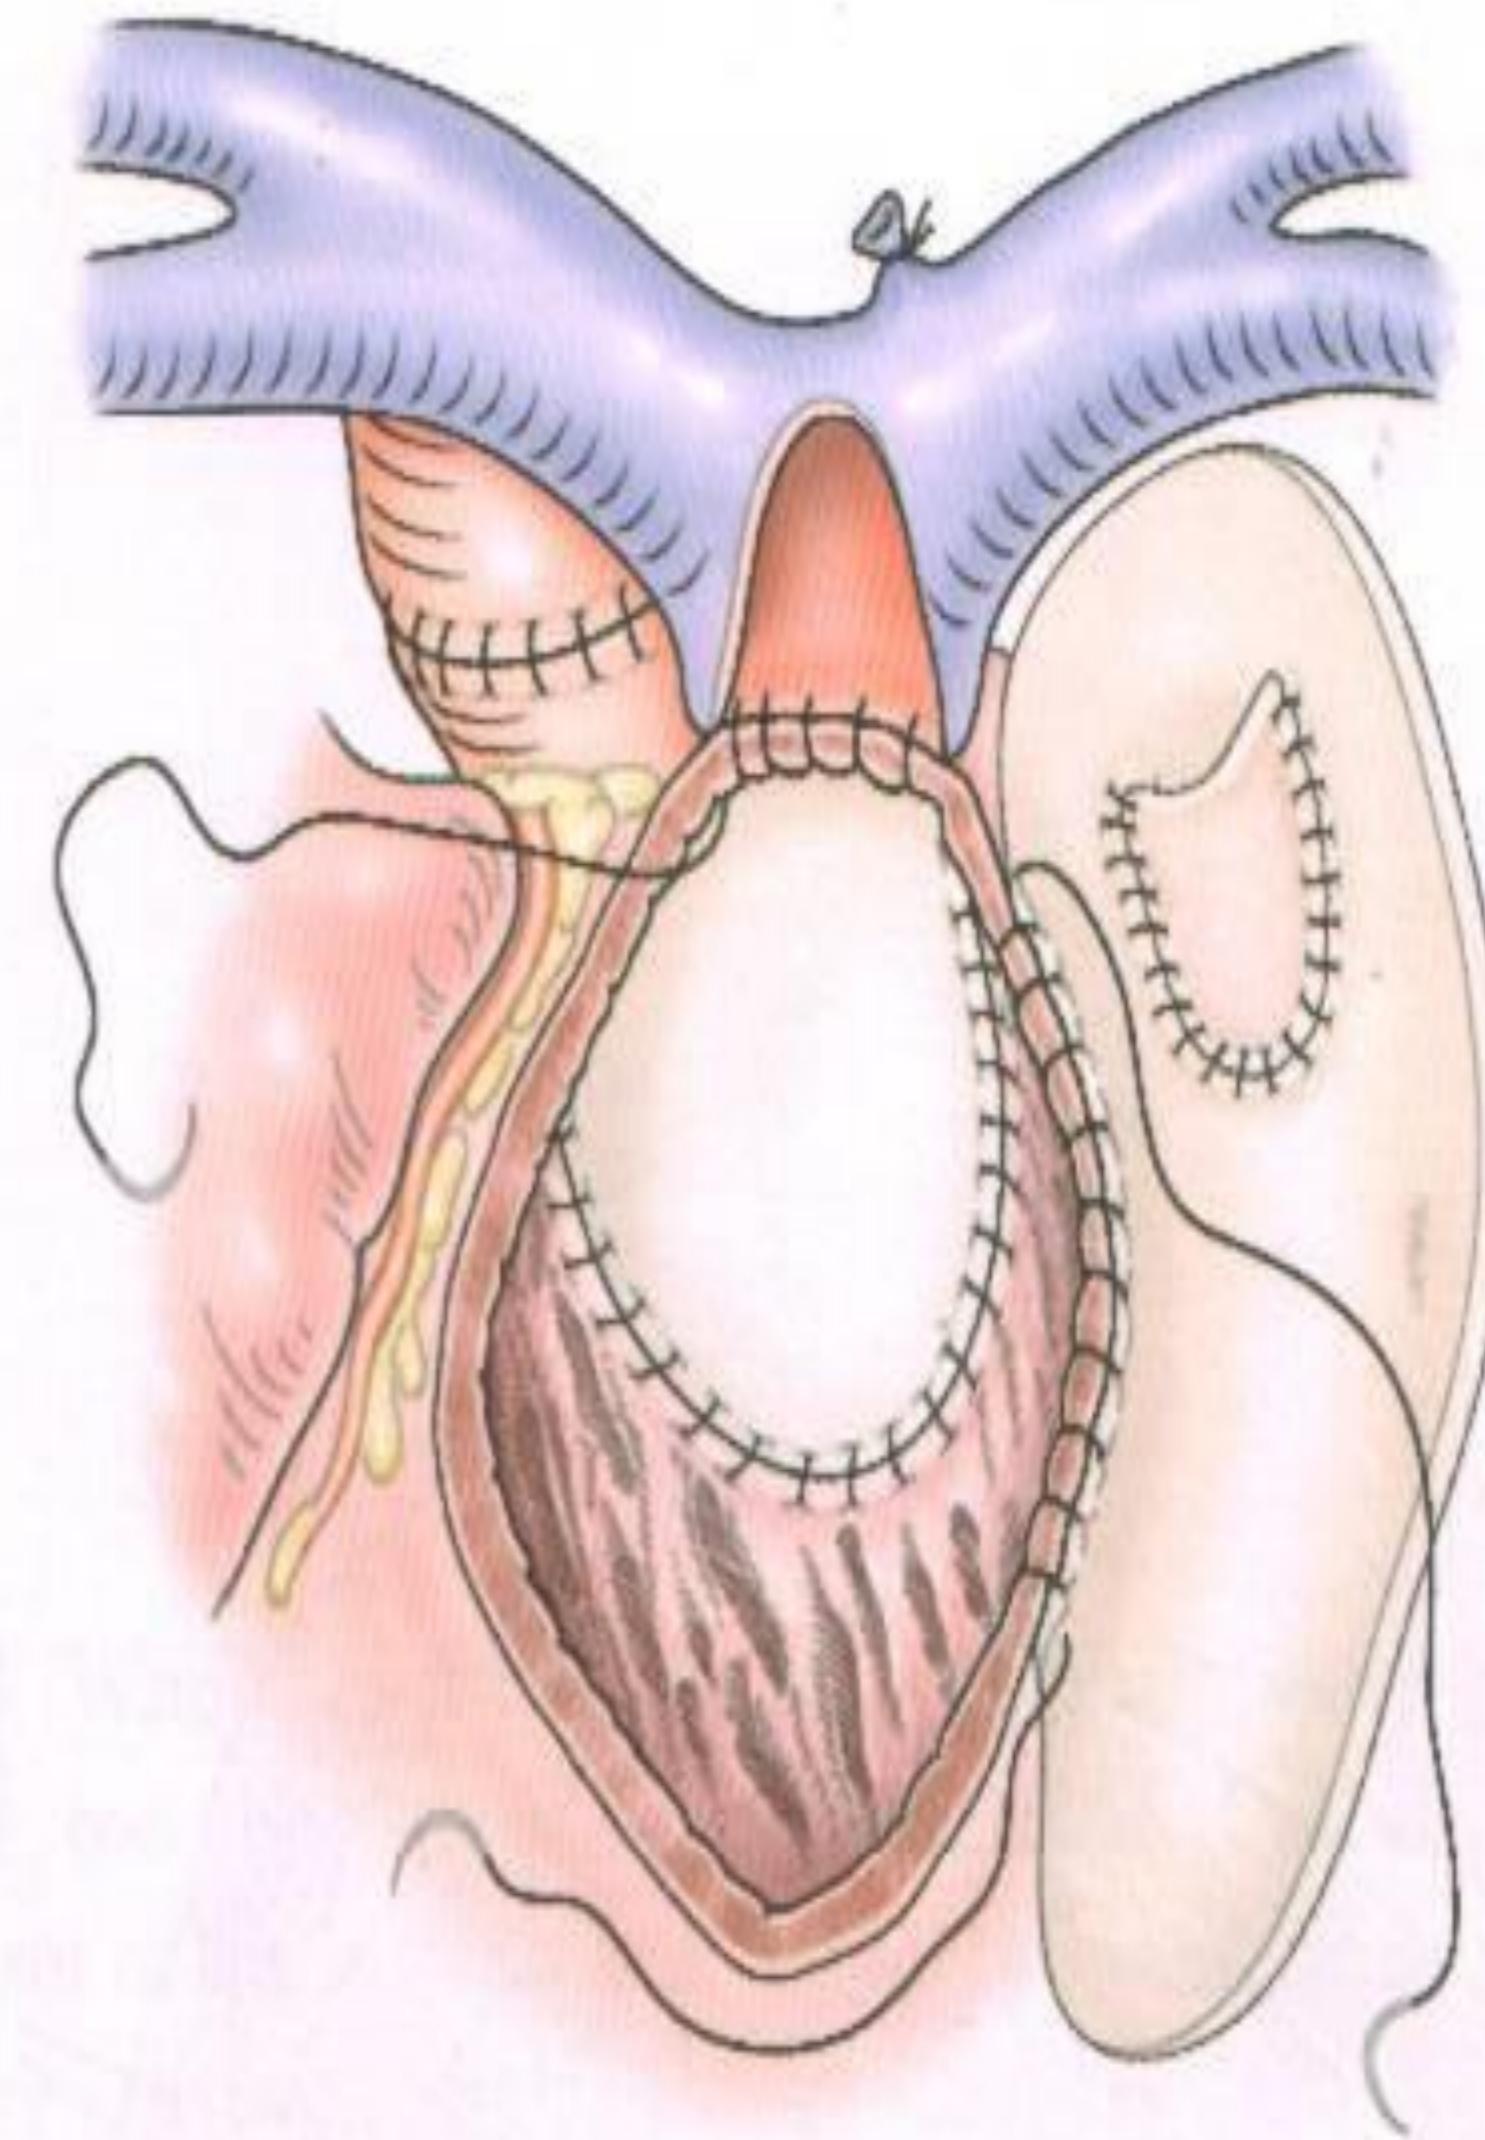

Reparación a le étage Ventriculaire

- Resection of conal septum.
 - (VSD baffling) Direct LV Ao connection.
 - Lecompte manouver for RV PA connection.
- Huge ascending aorta.
 - Posterior compression of pulmonary branches.
- Anterior compression by sternum.
- Pulmonary Regurgitation.

6a

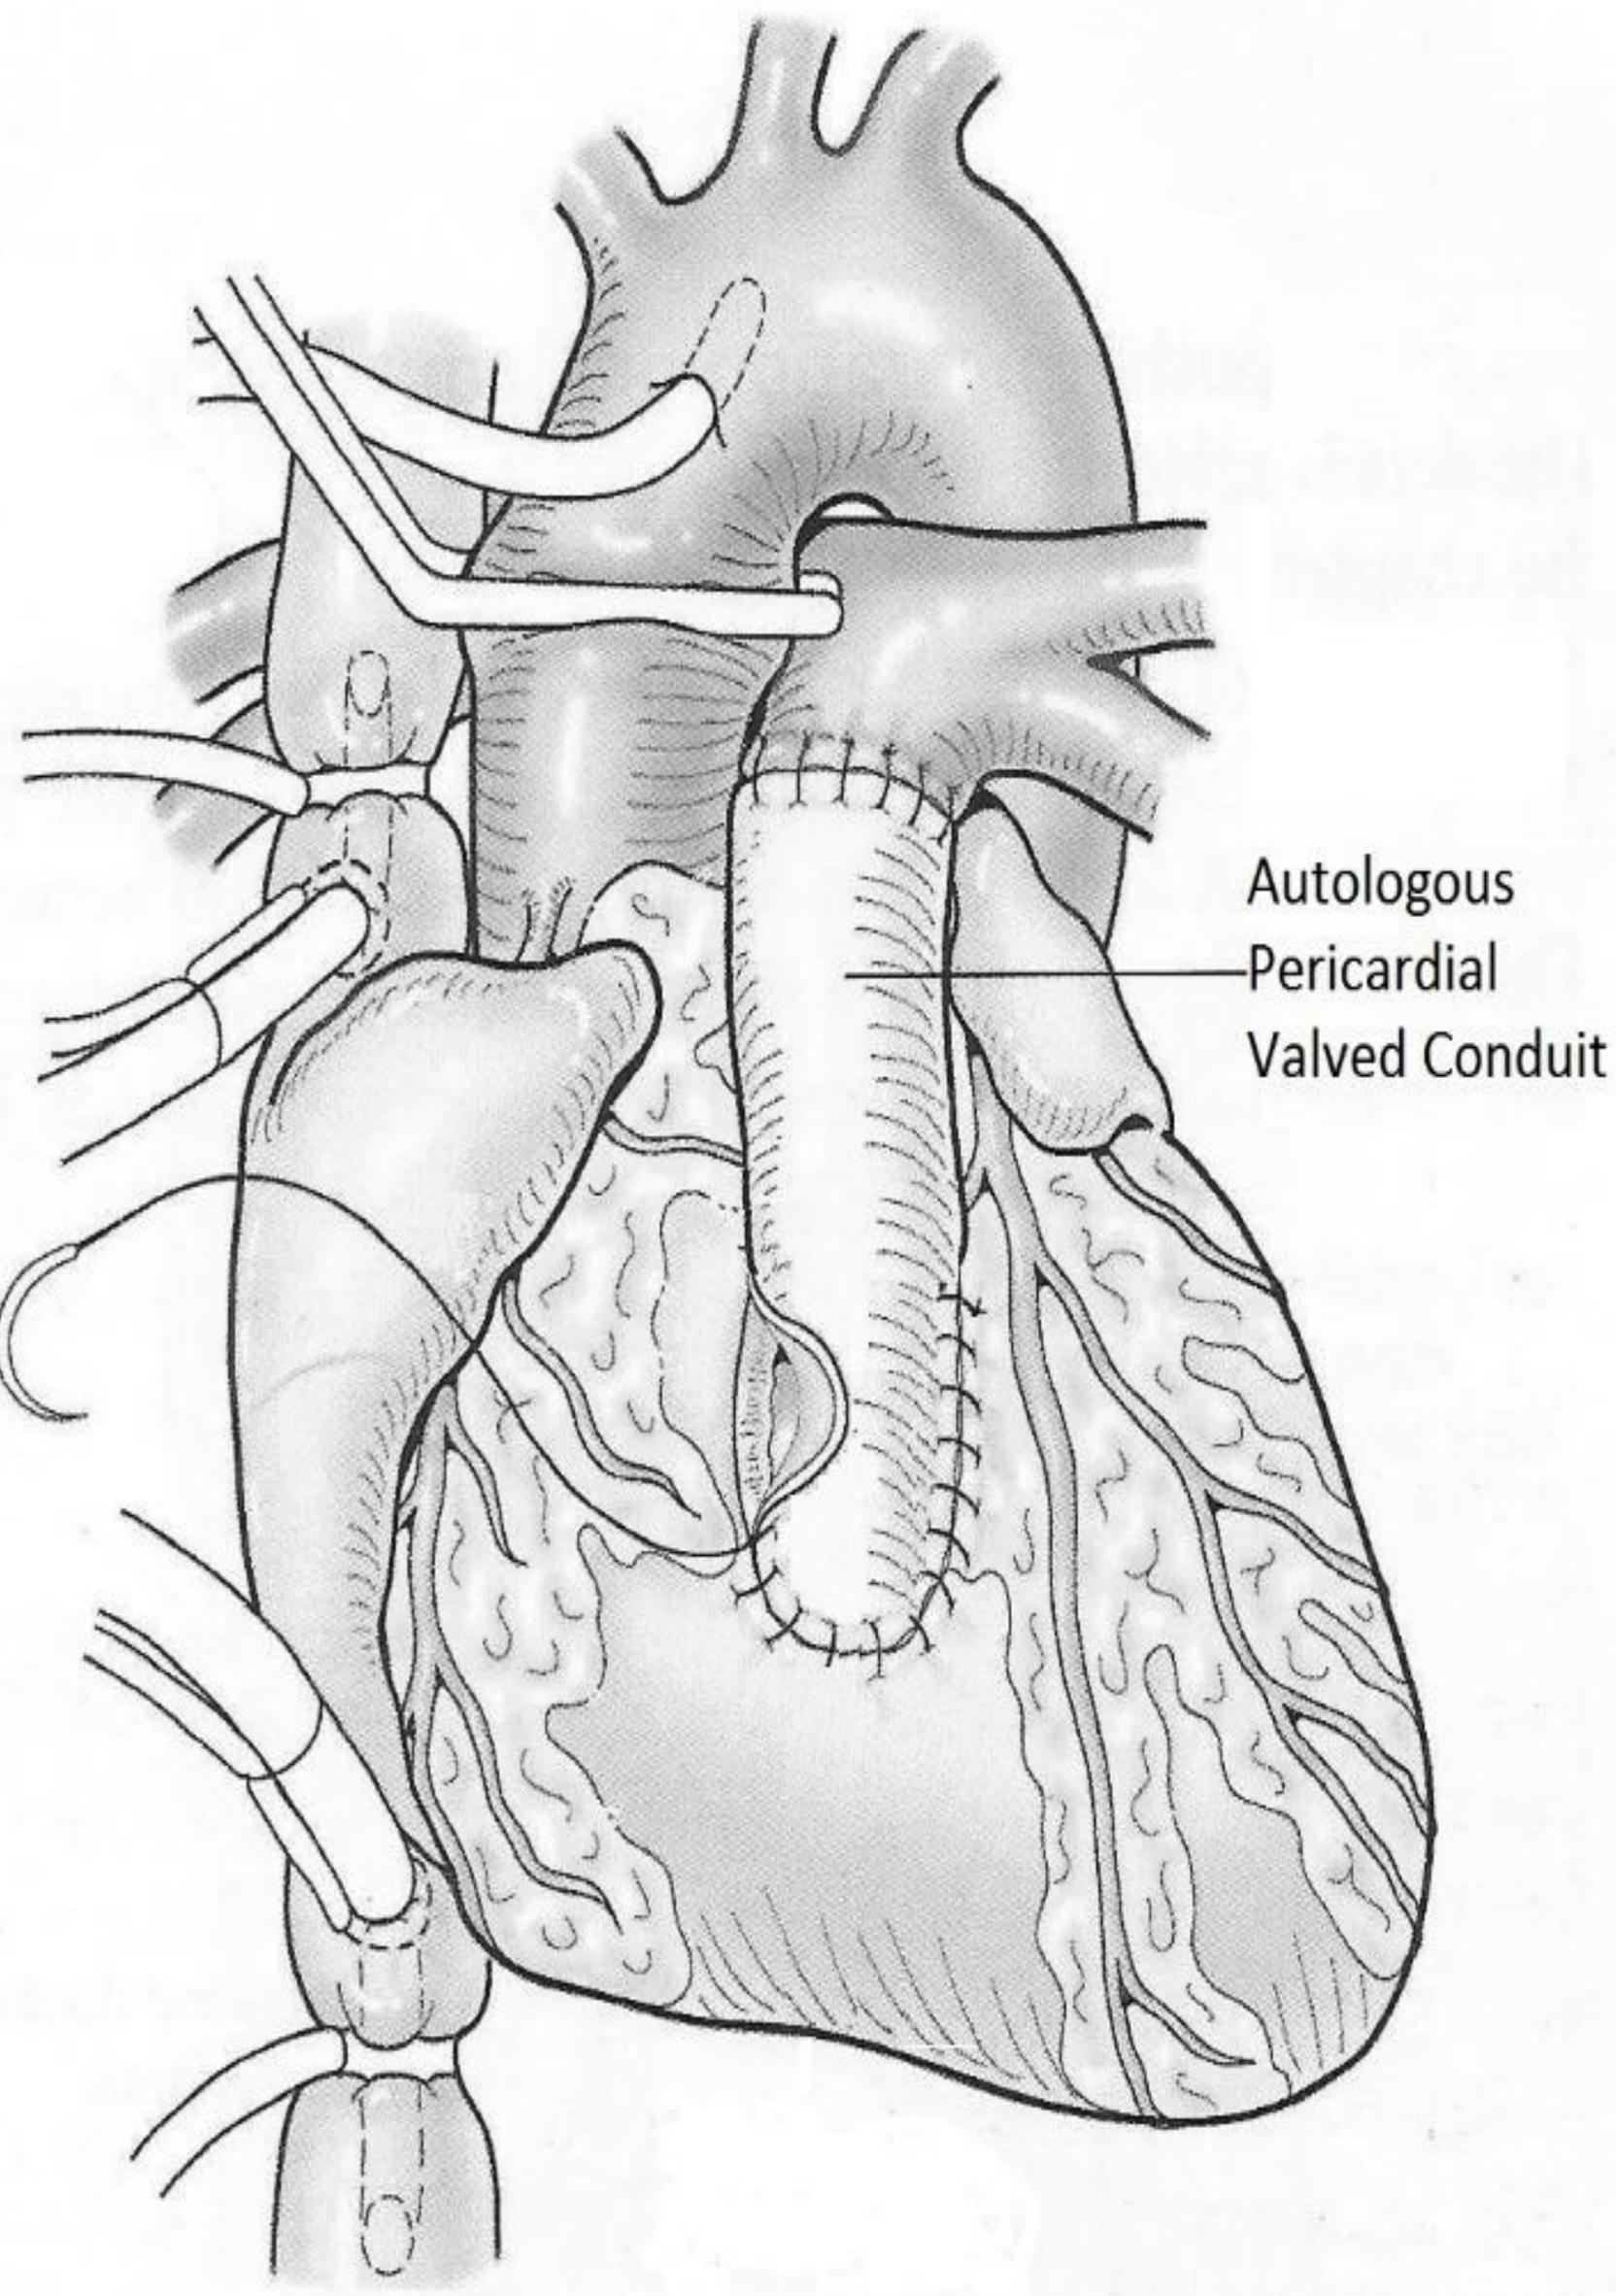

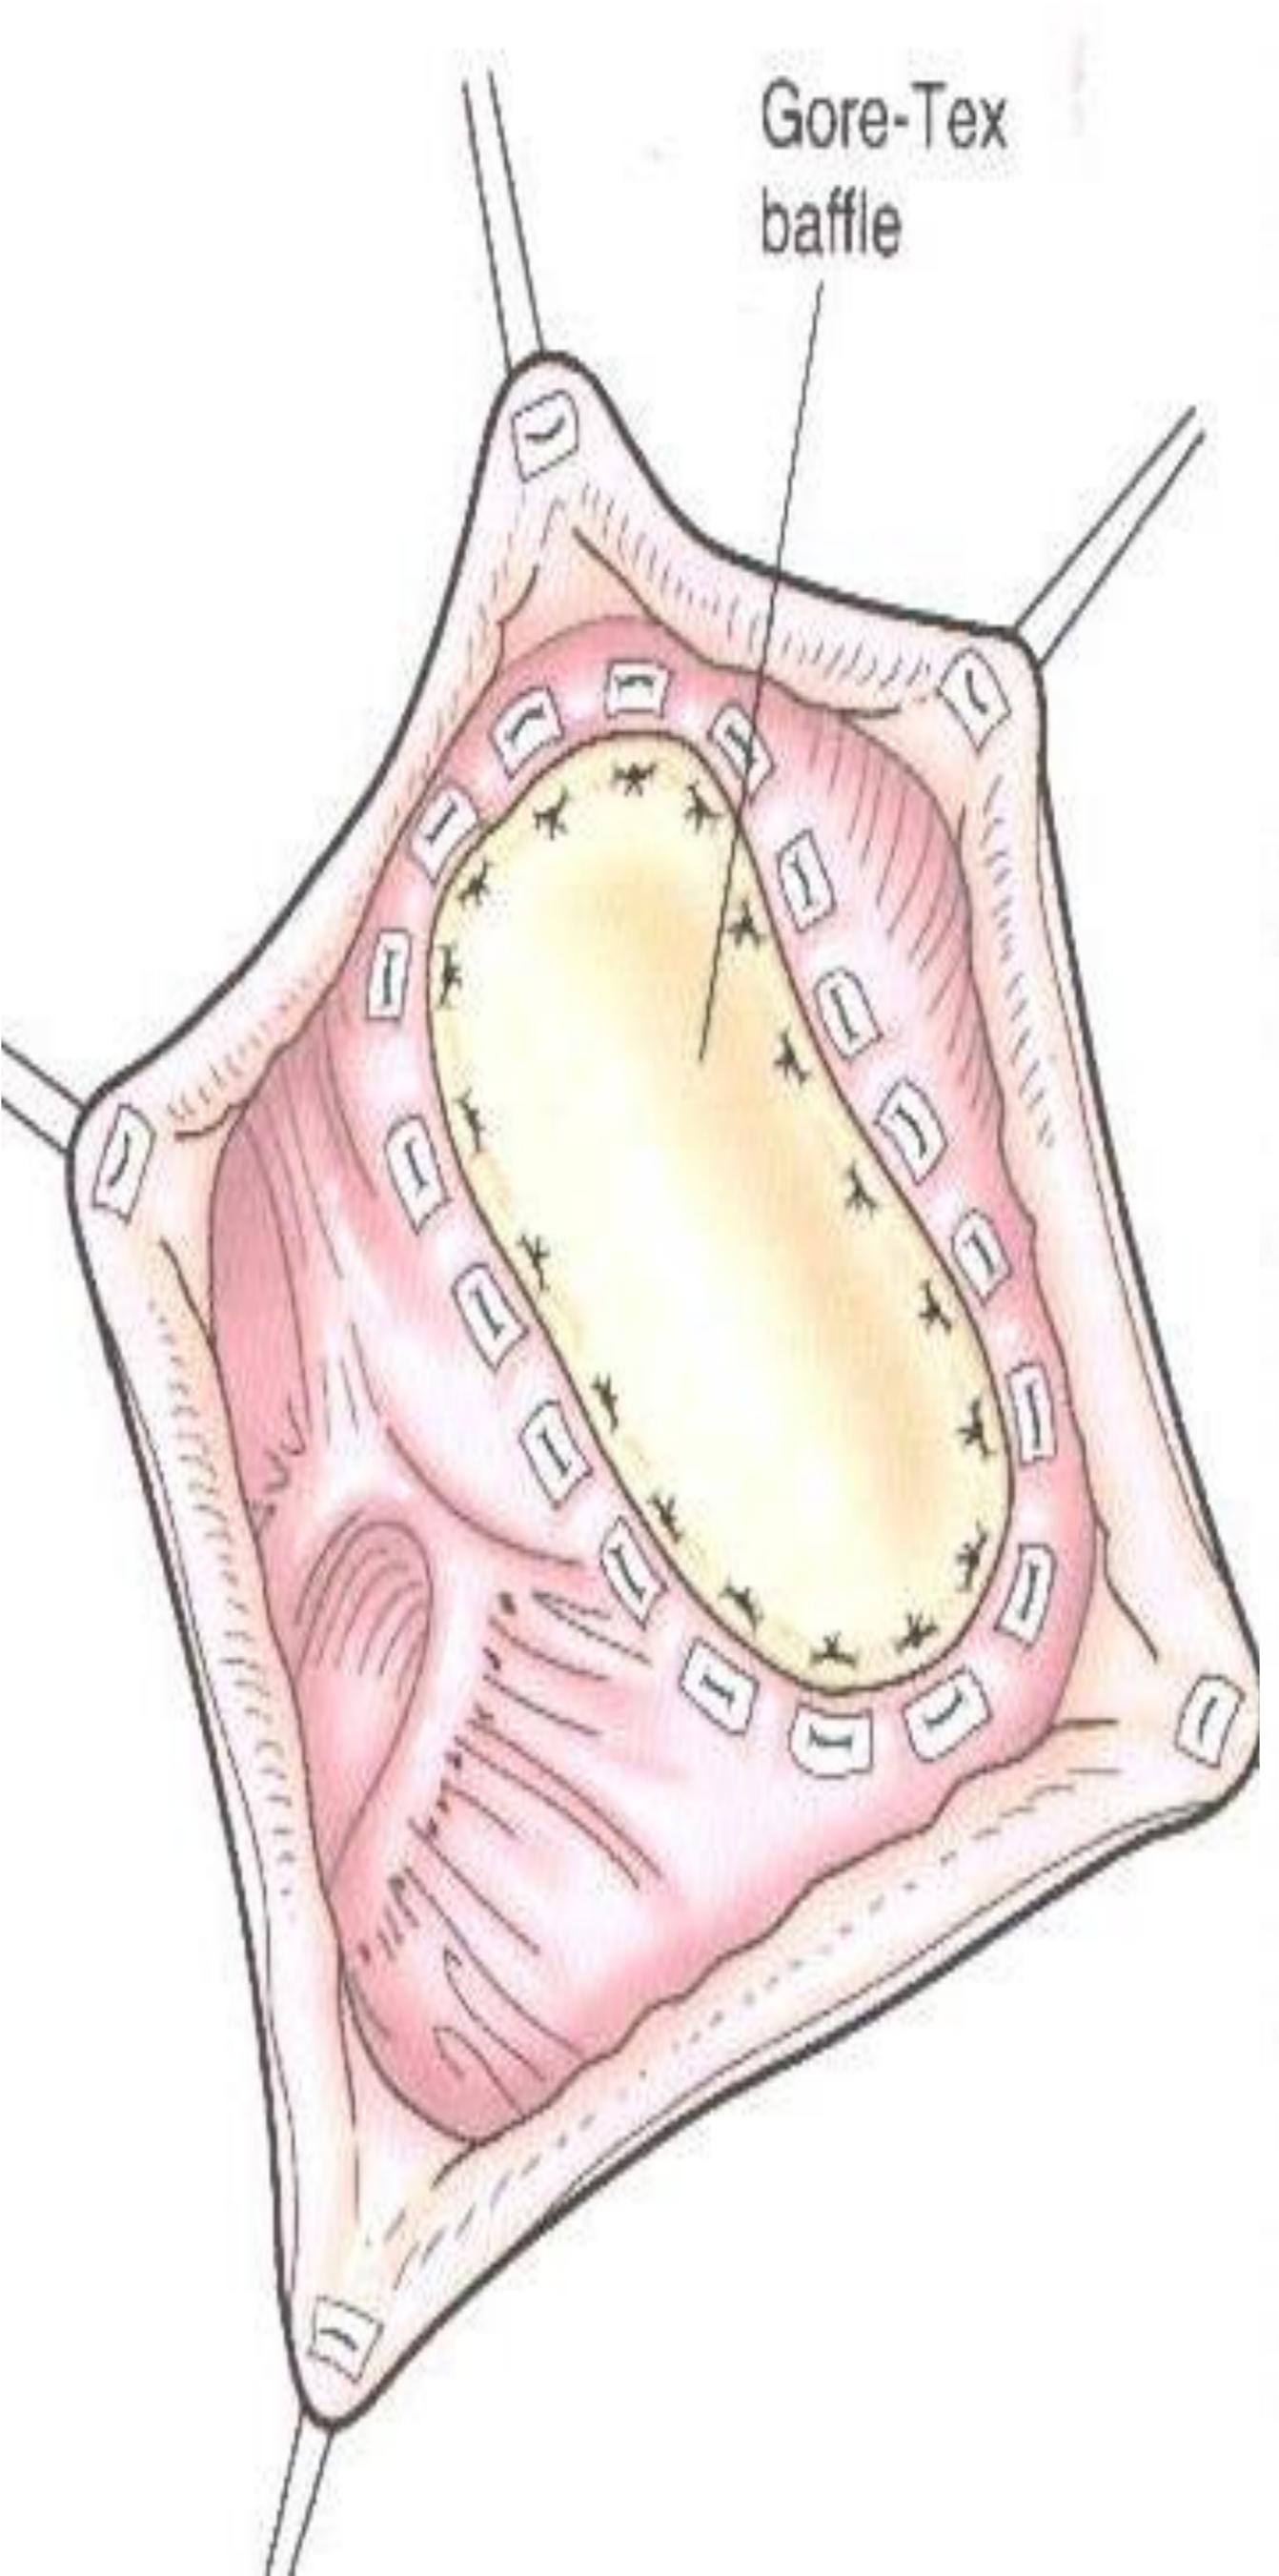

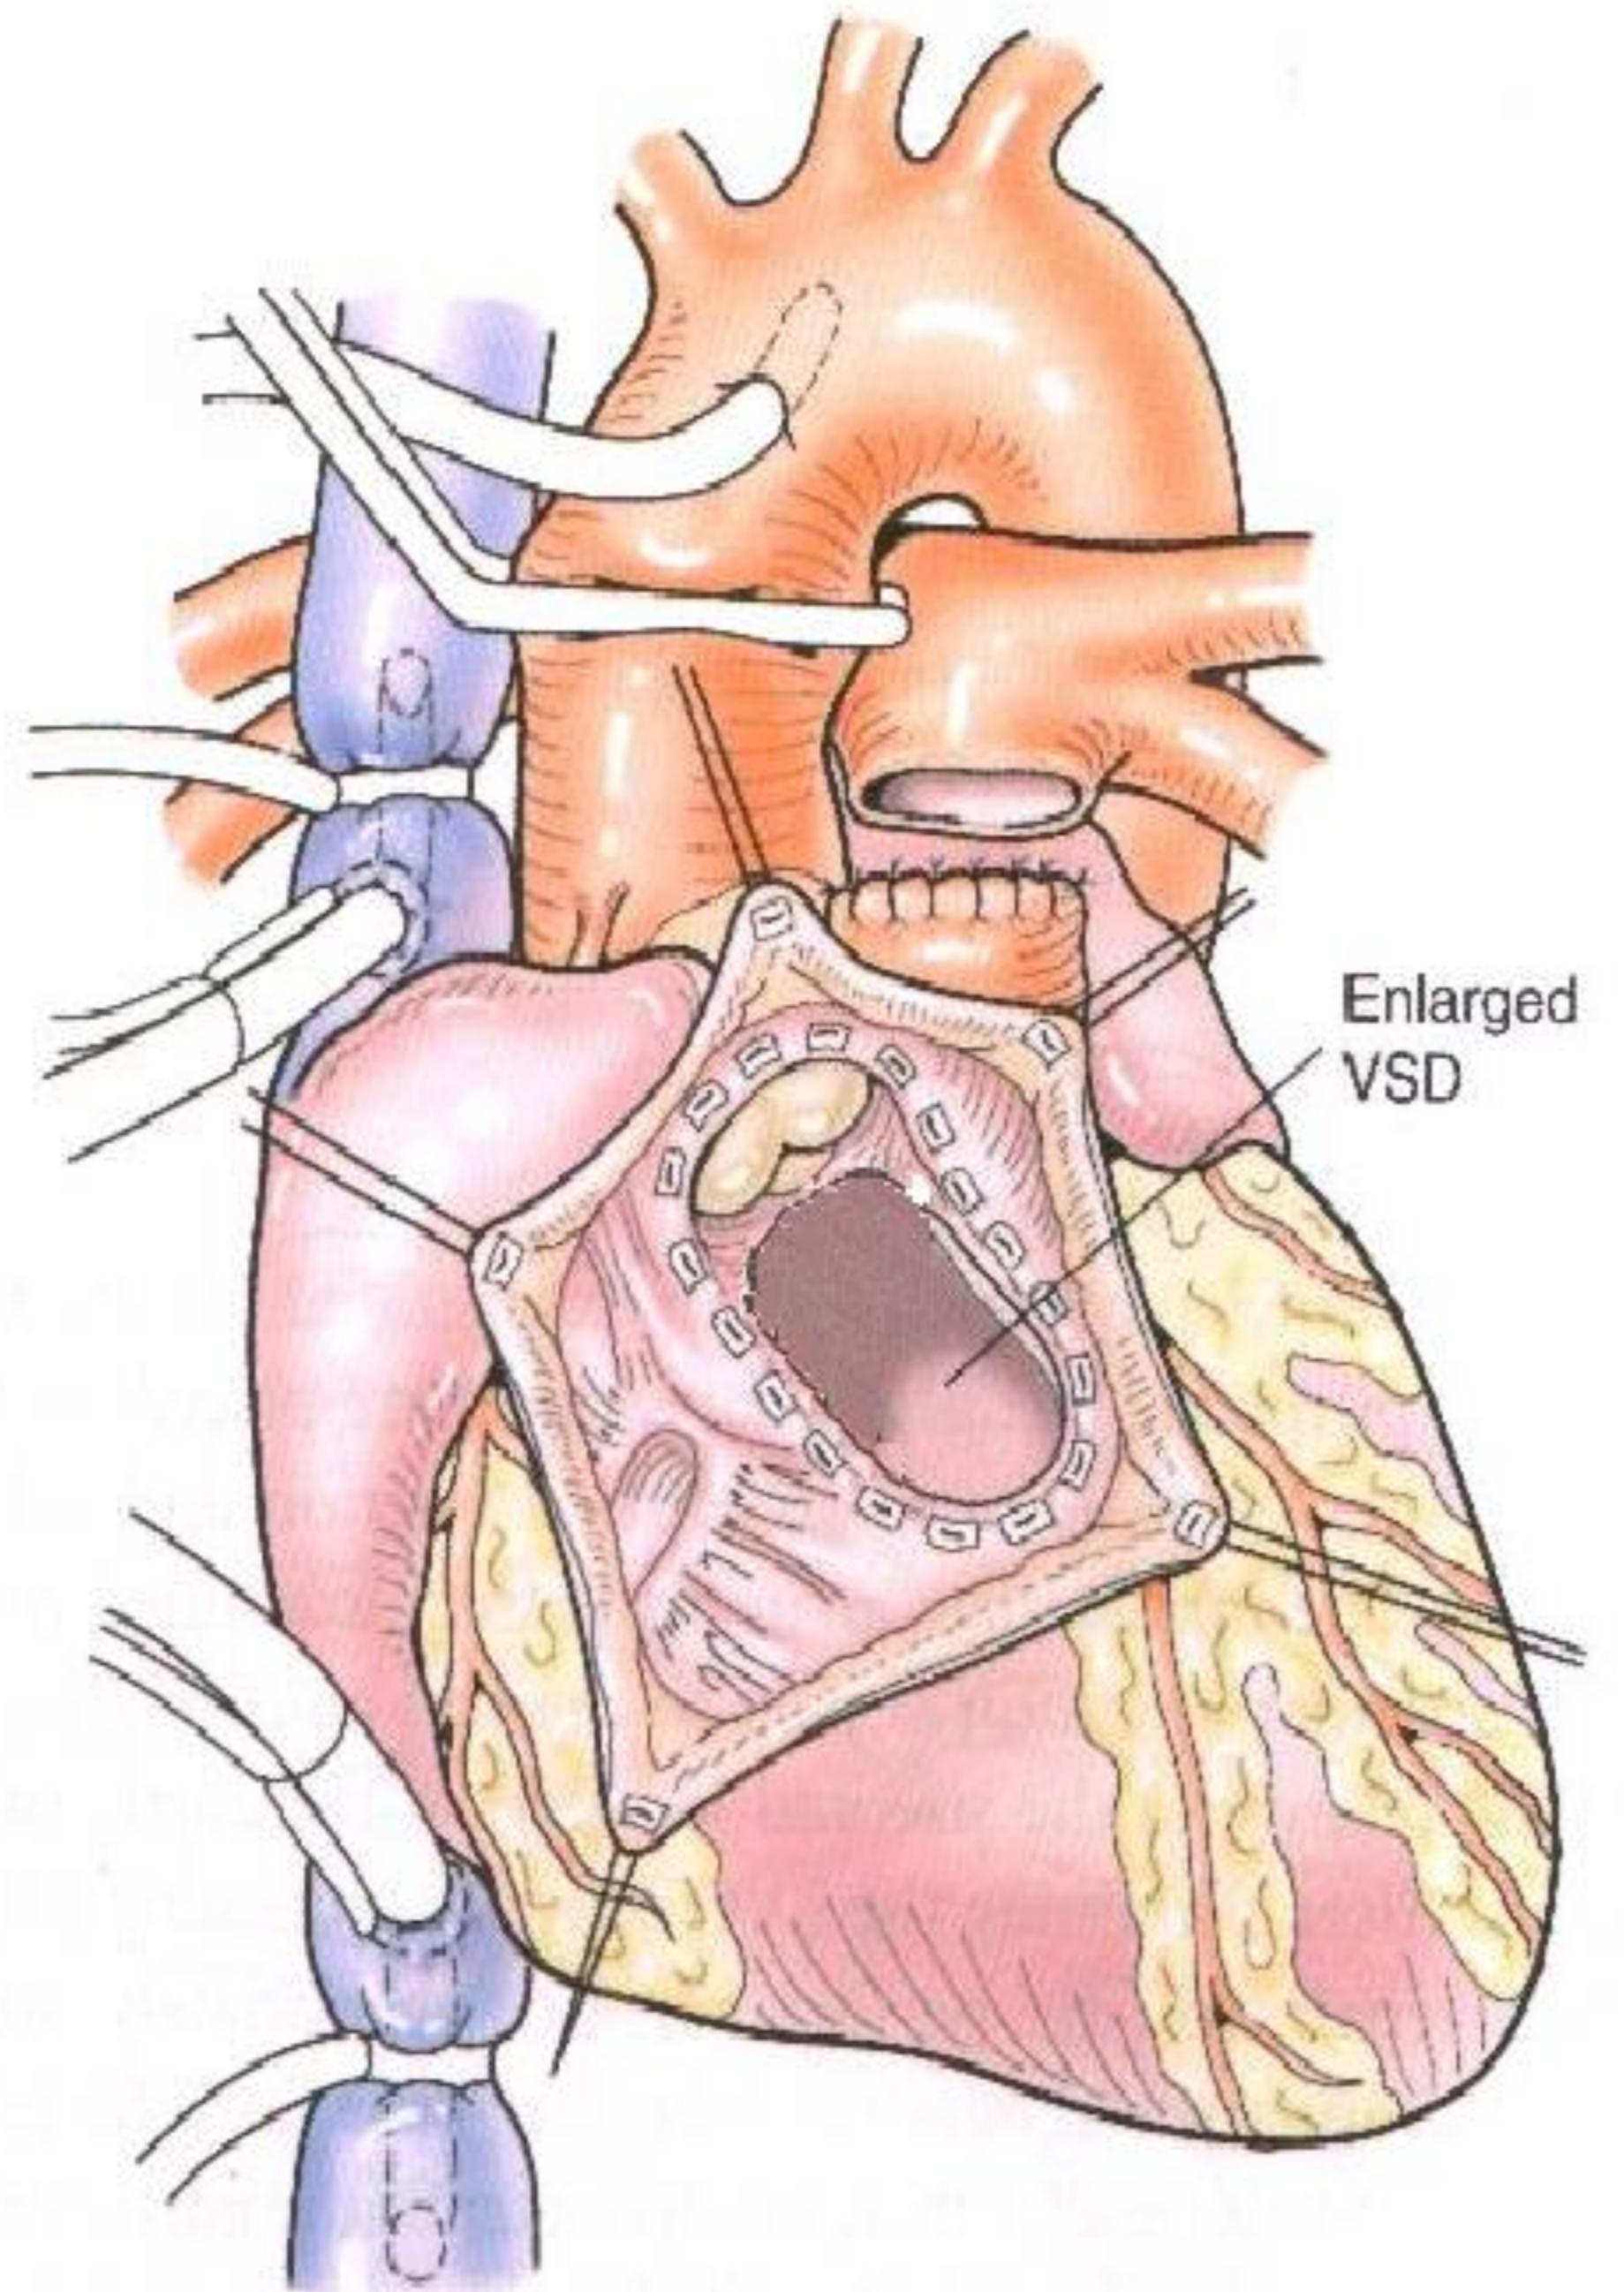

6b

Extracardiac patch

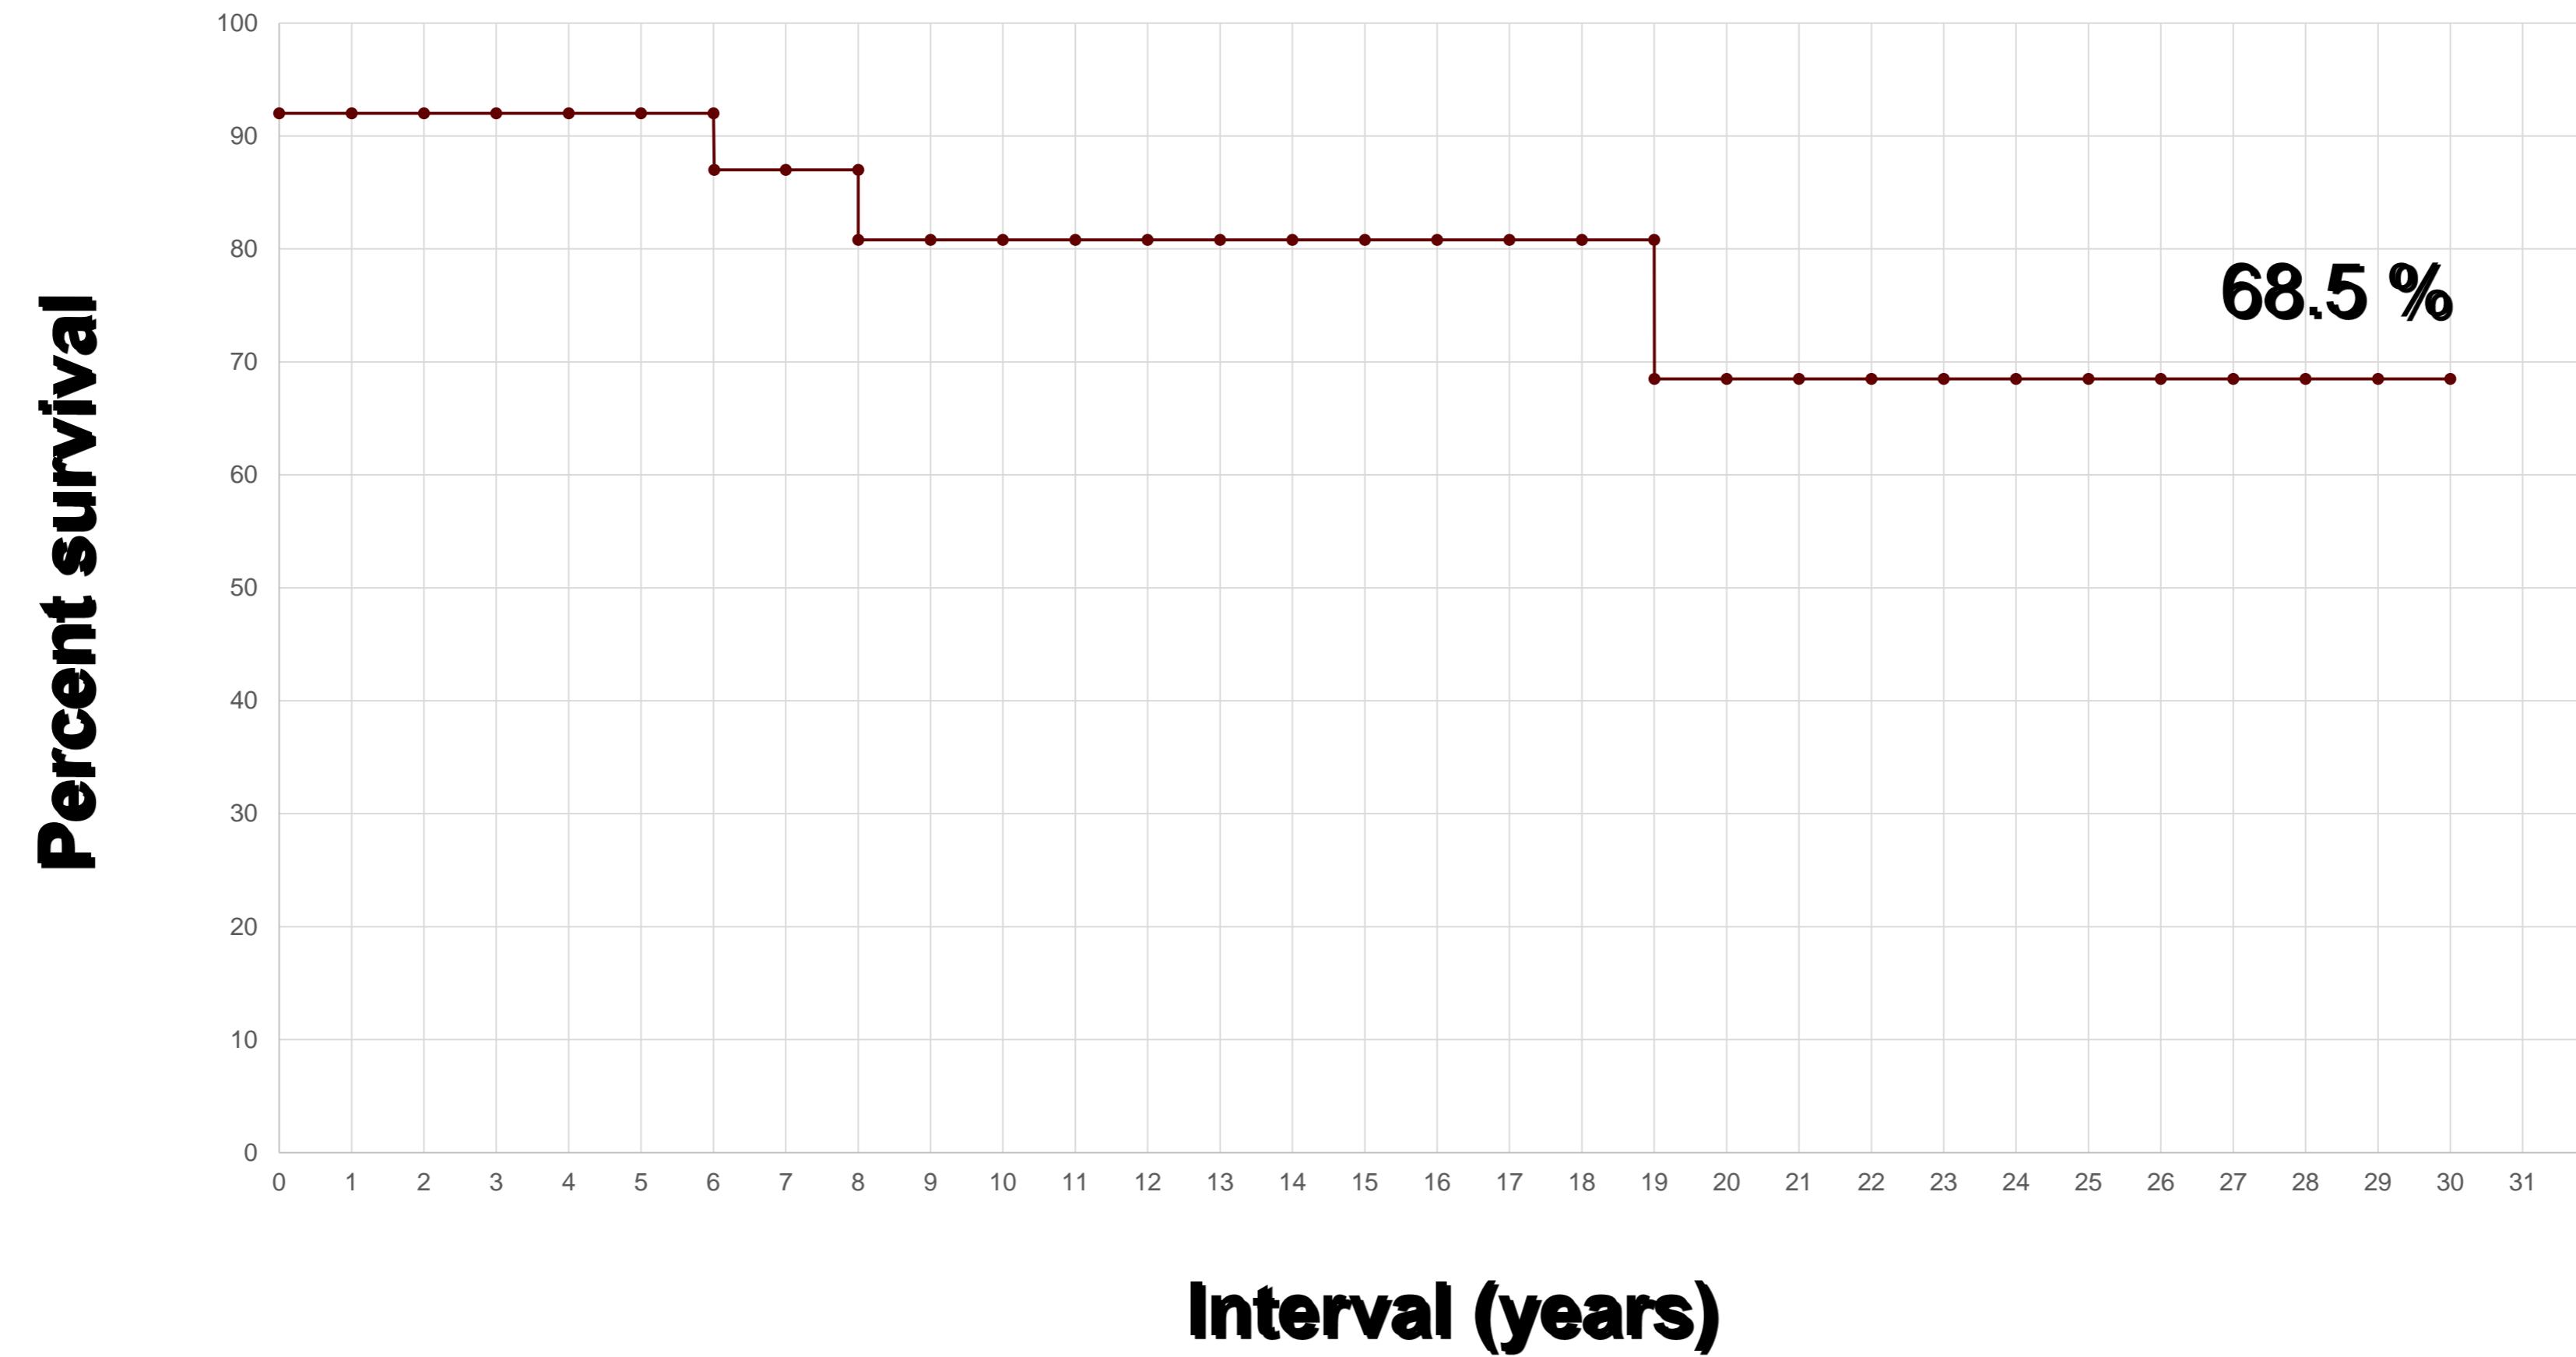

Rastelli with APVC

June 1983 – Nov 2018

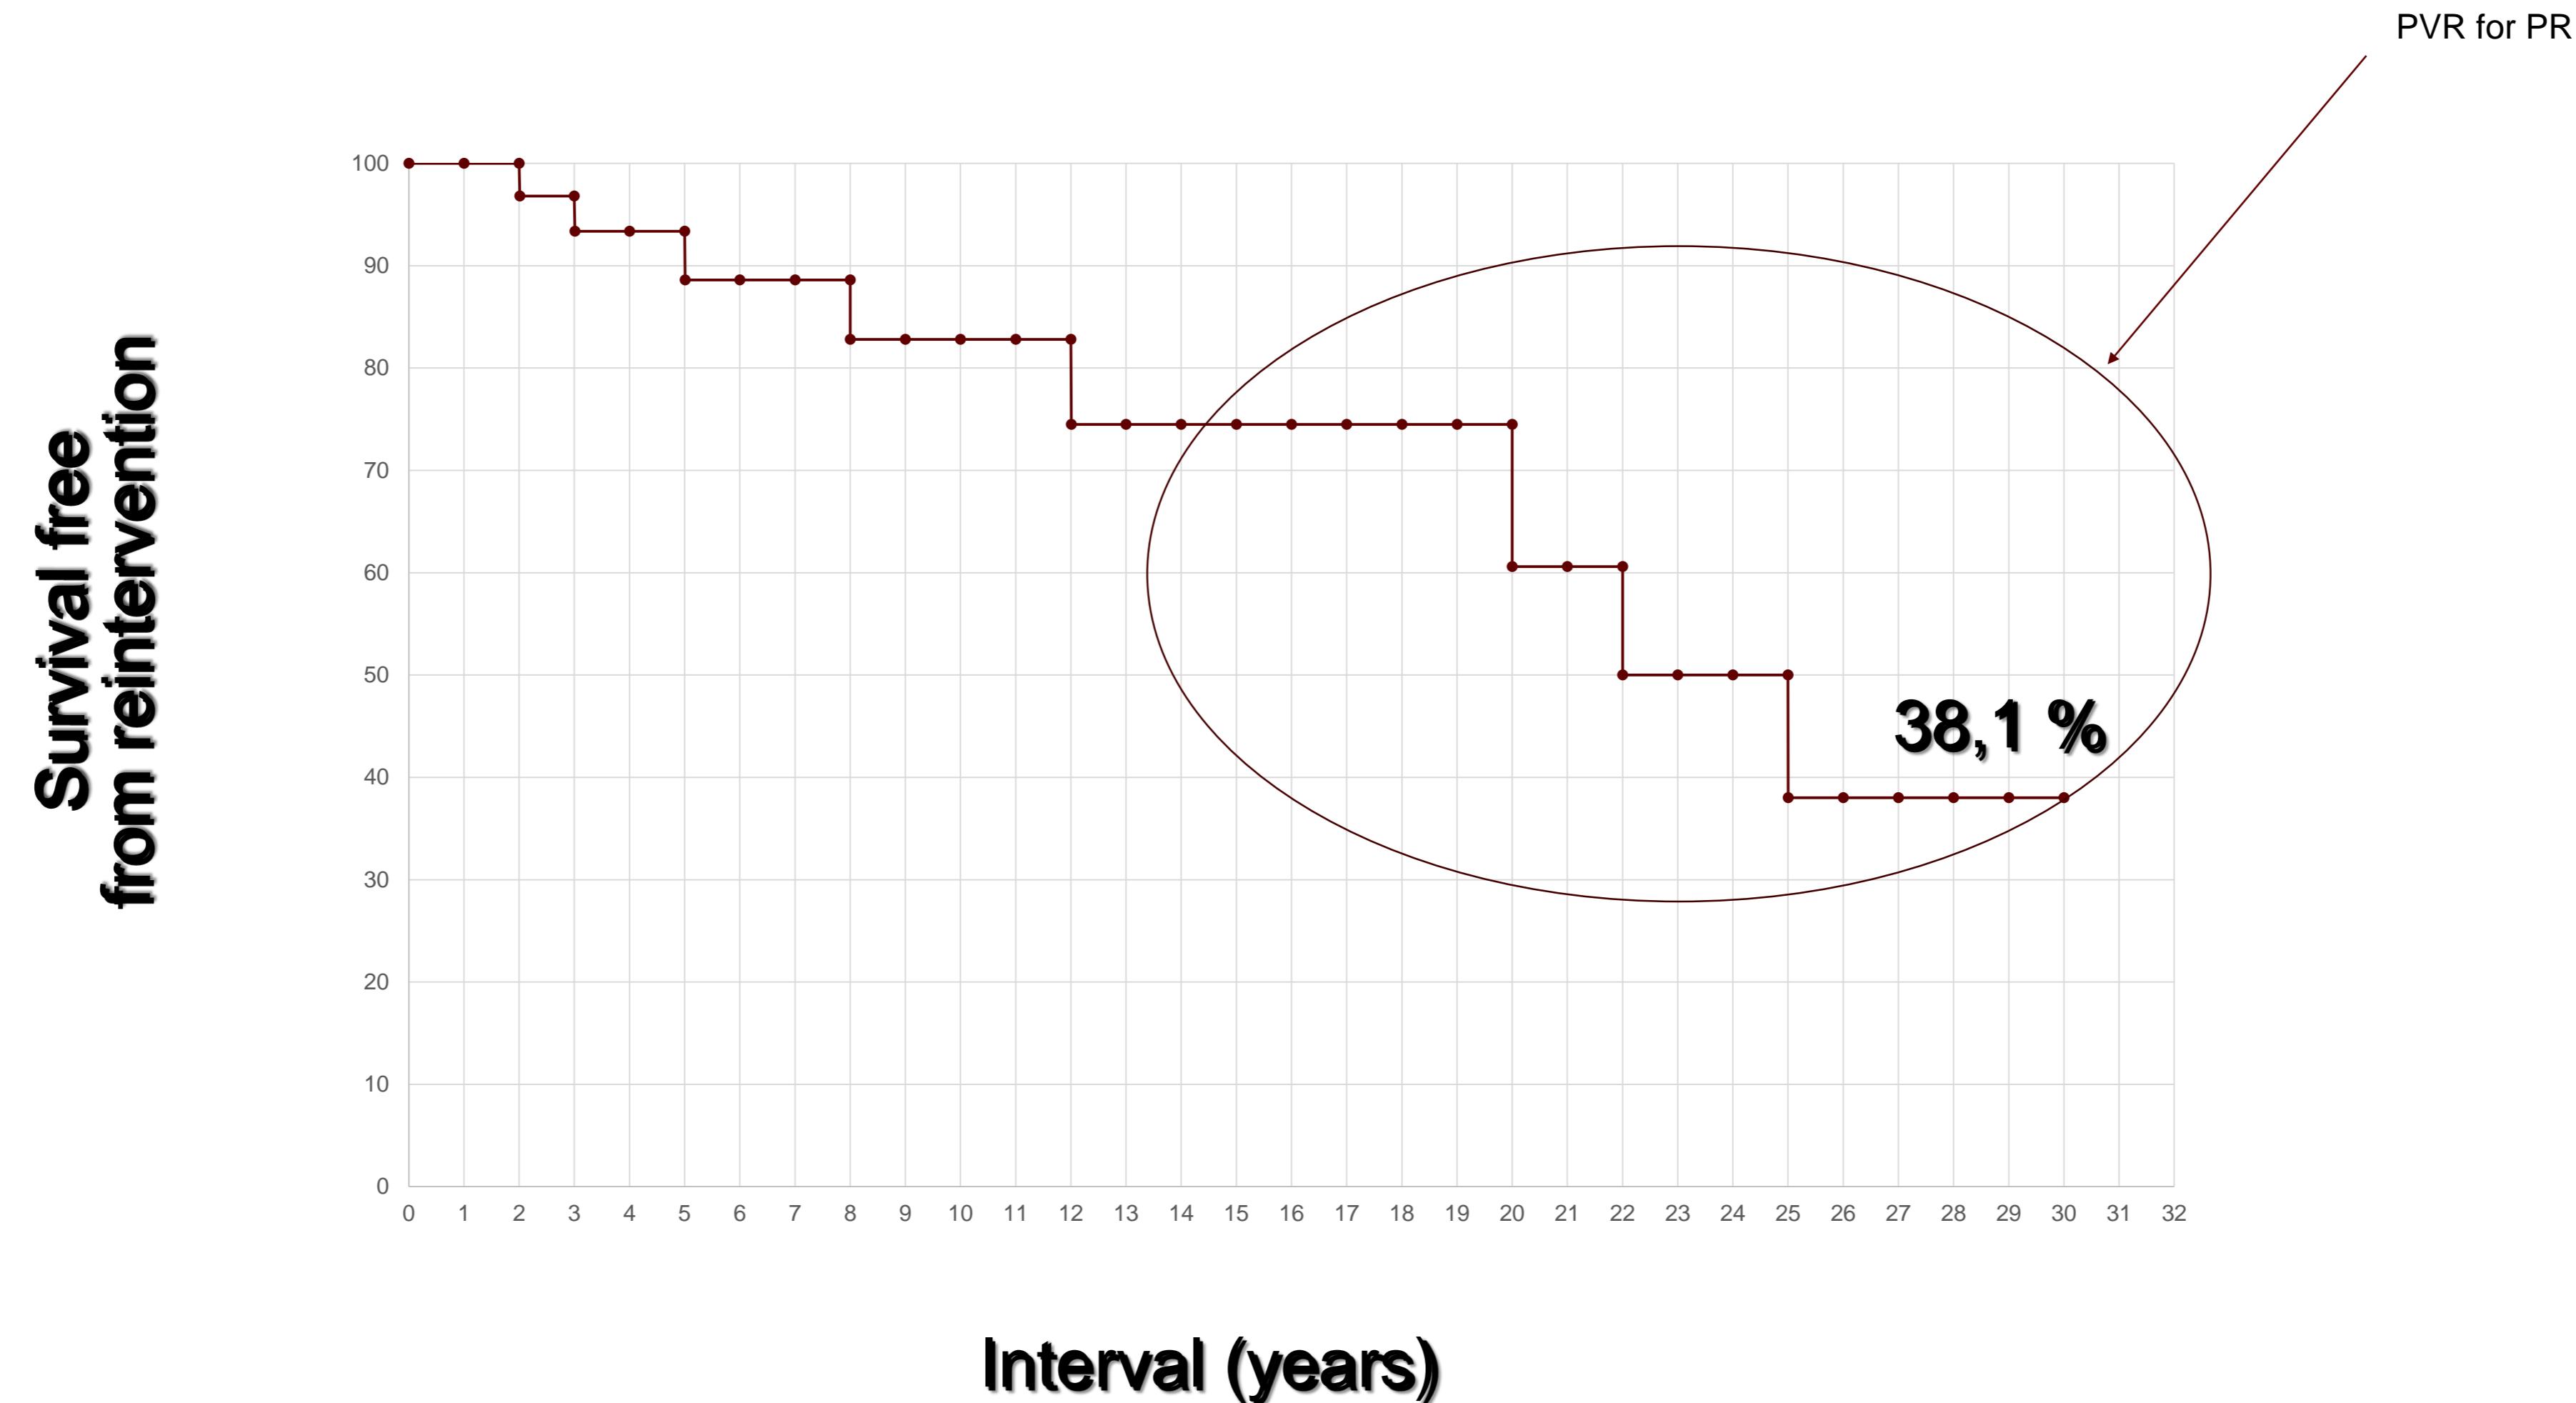

- Enlargement of VSD.
- Baffling with PTFE or pericardium.
- Pericardial valved conduit for RV PA connection.
- Mortality $4 / 54 = 7,4 \%$
- None in the last 18 years.
- Late mortality: 4/45.

Rastelli with APVC

Freedom from Reintervention

Summary

- Best option Rastelli:
 - PA or PS with severe PV ann hypoplasia. $Z < 5$.
 - Straight LVOT after VSD baffling.
 - Related conoventricular VSD.
 - Mitral Valve abnormal attachments & Cleft in TGA.
 - NO TV Straddling
 - NO RV hypoplasia.

Summary II

- Best option ASO when mild hypo PV annulus present. ($Z > 2$)
 - Decent PV. Mild grade of dysplasia
- Best option Nikaidoh when
 - PV annulus between $Z = -2$ to -5 and or Dysplastic PV.
 - Delayed Repair. (3 m to 1 yr)
 - VSD is non committed (inlet type), Straddling TV and/or restrictive.
- Best option 1 and 1/2 or Fontan:
 - Hypo RV.
 - Unfavorable coronary anatomy.

Summary III

- There is no optimal procedure for all TGA VSD and LVOTO.
- Many anatomical variants.
- Avoid forcing indications of a procedure when the anatomic setting is not appropriate.
- Apply the best procedure to a specific anatomy.
- Excellent results can be achieved. Eur J Cardiothorac Surg. 2016 Oct;50(4):617-625 Hraska V
