

STS/EACTS Latin America Cardiovascular Surgery Conference

November 15-17, 2018

Hilton Cartagena | Cartagena, Colombia

New Strategies in Cardiac Intensive Care

Gil Wernovsky, MD, FAAP, FACC

*Senior Consultant in Cardiology and Cardiac Critical Care
Professor of Pediatrics
Children's National Health System
Washington DC USA*

Disclosures

I have no real or perceived conflicts of interest related to this talk

I will not be discussing off-label use of drugs or devices

Outline

I will **not** be discussing:

- New Medicines
- New Operations
- New Ventilator Strategies

1. Reducing the Frequency of Cardiac Arrest

- And increasing the critical examination of those that do occur

2. Improving Monitoring

- At the Bedside
- Telemedicine

3. Re-thinking Single Ventricle Physiology

4. Neuroprotection and Neurodevelopment – (16:28)

gwernovsky@childrensnational.org

Reducing the Frequency of Cardiac Arrest

Emphasis Tipping From Quality of CPR towards Reduction of Cardiac Arrests

Darren Klugman, MD

Wes Diddle, MD

Justine Fortkiewicz-Mize, MSN

Reducing the Frequency of Cardiac Arrest

Strategies

1. Daily Identification of High-Risk Patients (“HRP”)
2. **Full** Team Rounds **Four** Times per Day
3. Shared Communication & “Mental Model”
4. Escalation Algorithm

CICU High Risk Cardiac Arrest Reduction Clinical Pathway Overview

	Day 1	Day 2-3	Day 4-5	Day 5-7
Overarching Goal	<input checked="" type="checkbox"/> Hemostasis <input checked="" type="checkbox"/> Hemodynamic Stability	<input checked="" type="checkbox"/> Hemodynamic Stability <input checked="" type="checkbox"/> Diuresis <input checked="" type="checkbox"/> Chest closure (as applicable)	<input checked="" type="checkbox"/> Diuresis <input checked="" type="checkbox"/> Wean to extubate	<input checked="" type="checkbox"/> Nutrition <input checked="" type="checkbox"/> Weaning

If not, why not?	<input type="checkbox"/> Massive Transfusion <input type="checkbox"/> Elective ECMO <input type="checkbox"/> TEG <input type="checkbox"/> CV surgery consult <input type="checkbox"/> Attending Peer Check	<input type="checkbox"/> Repeat echo <input type="checkbox"/> Cardiac cath <input type="checkbox"/> Stress dose steroids <input type="checkbox"/> PD cath placement <input type="checkbox"/> Attending Peer Check	<input type="checkbox"/> Attending Peer check	<input type="checkbox"/> Attending Peer check
HAC/QI Reminders		Remove LA Remove foley		Remove RA Place PICC?
Inclusion Criteria & Guidance for Use Please check one of the following HRP indications:			<h2 style="margin: 0;">PATIENT LABEL</h2>	
<p><u>Surgical Patient Criteria</u> All neonates (<30 days) after cardiac surgery requiring CPB Any patients undergoing a Stage 1 palliation (e.g. PAB, hybrid, shunt, etc) <i>Duration of bundle activation:</i> from postoperative admission <u>until 24 hours after extubation</u> to maximum of 7 days postoperative</p> <p><u>Medical Patient Criteria</u> Any medical patients requiring intubation/mechanical ventilation within first 4 hours <i>Duration of bundle activation:</i> from intubation <u>until 24 hours after extubation</u> to maximum of 72 hours from intubation</p> <p><u>Other Indication</u> Any patients the care team feels is high risk. Details: _____</p>				
<p>*Pathway should be automatically discontinued if patient is placed on ECMO *CICU attending: Return completed tools w/ patient label attached to CARP Box @ Welcome 2</p>			<p>Date/Time initiated _____ LIP Initials _____</p>	

GOAL: Hemostasis & Hemodynamic Stability (Day 1)

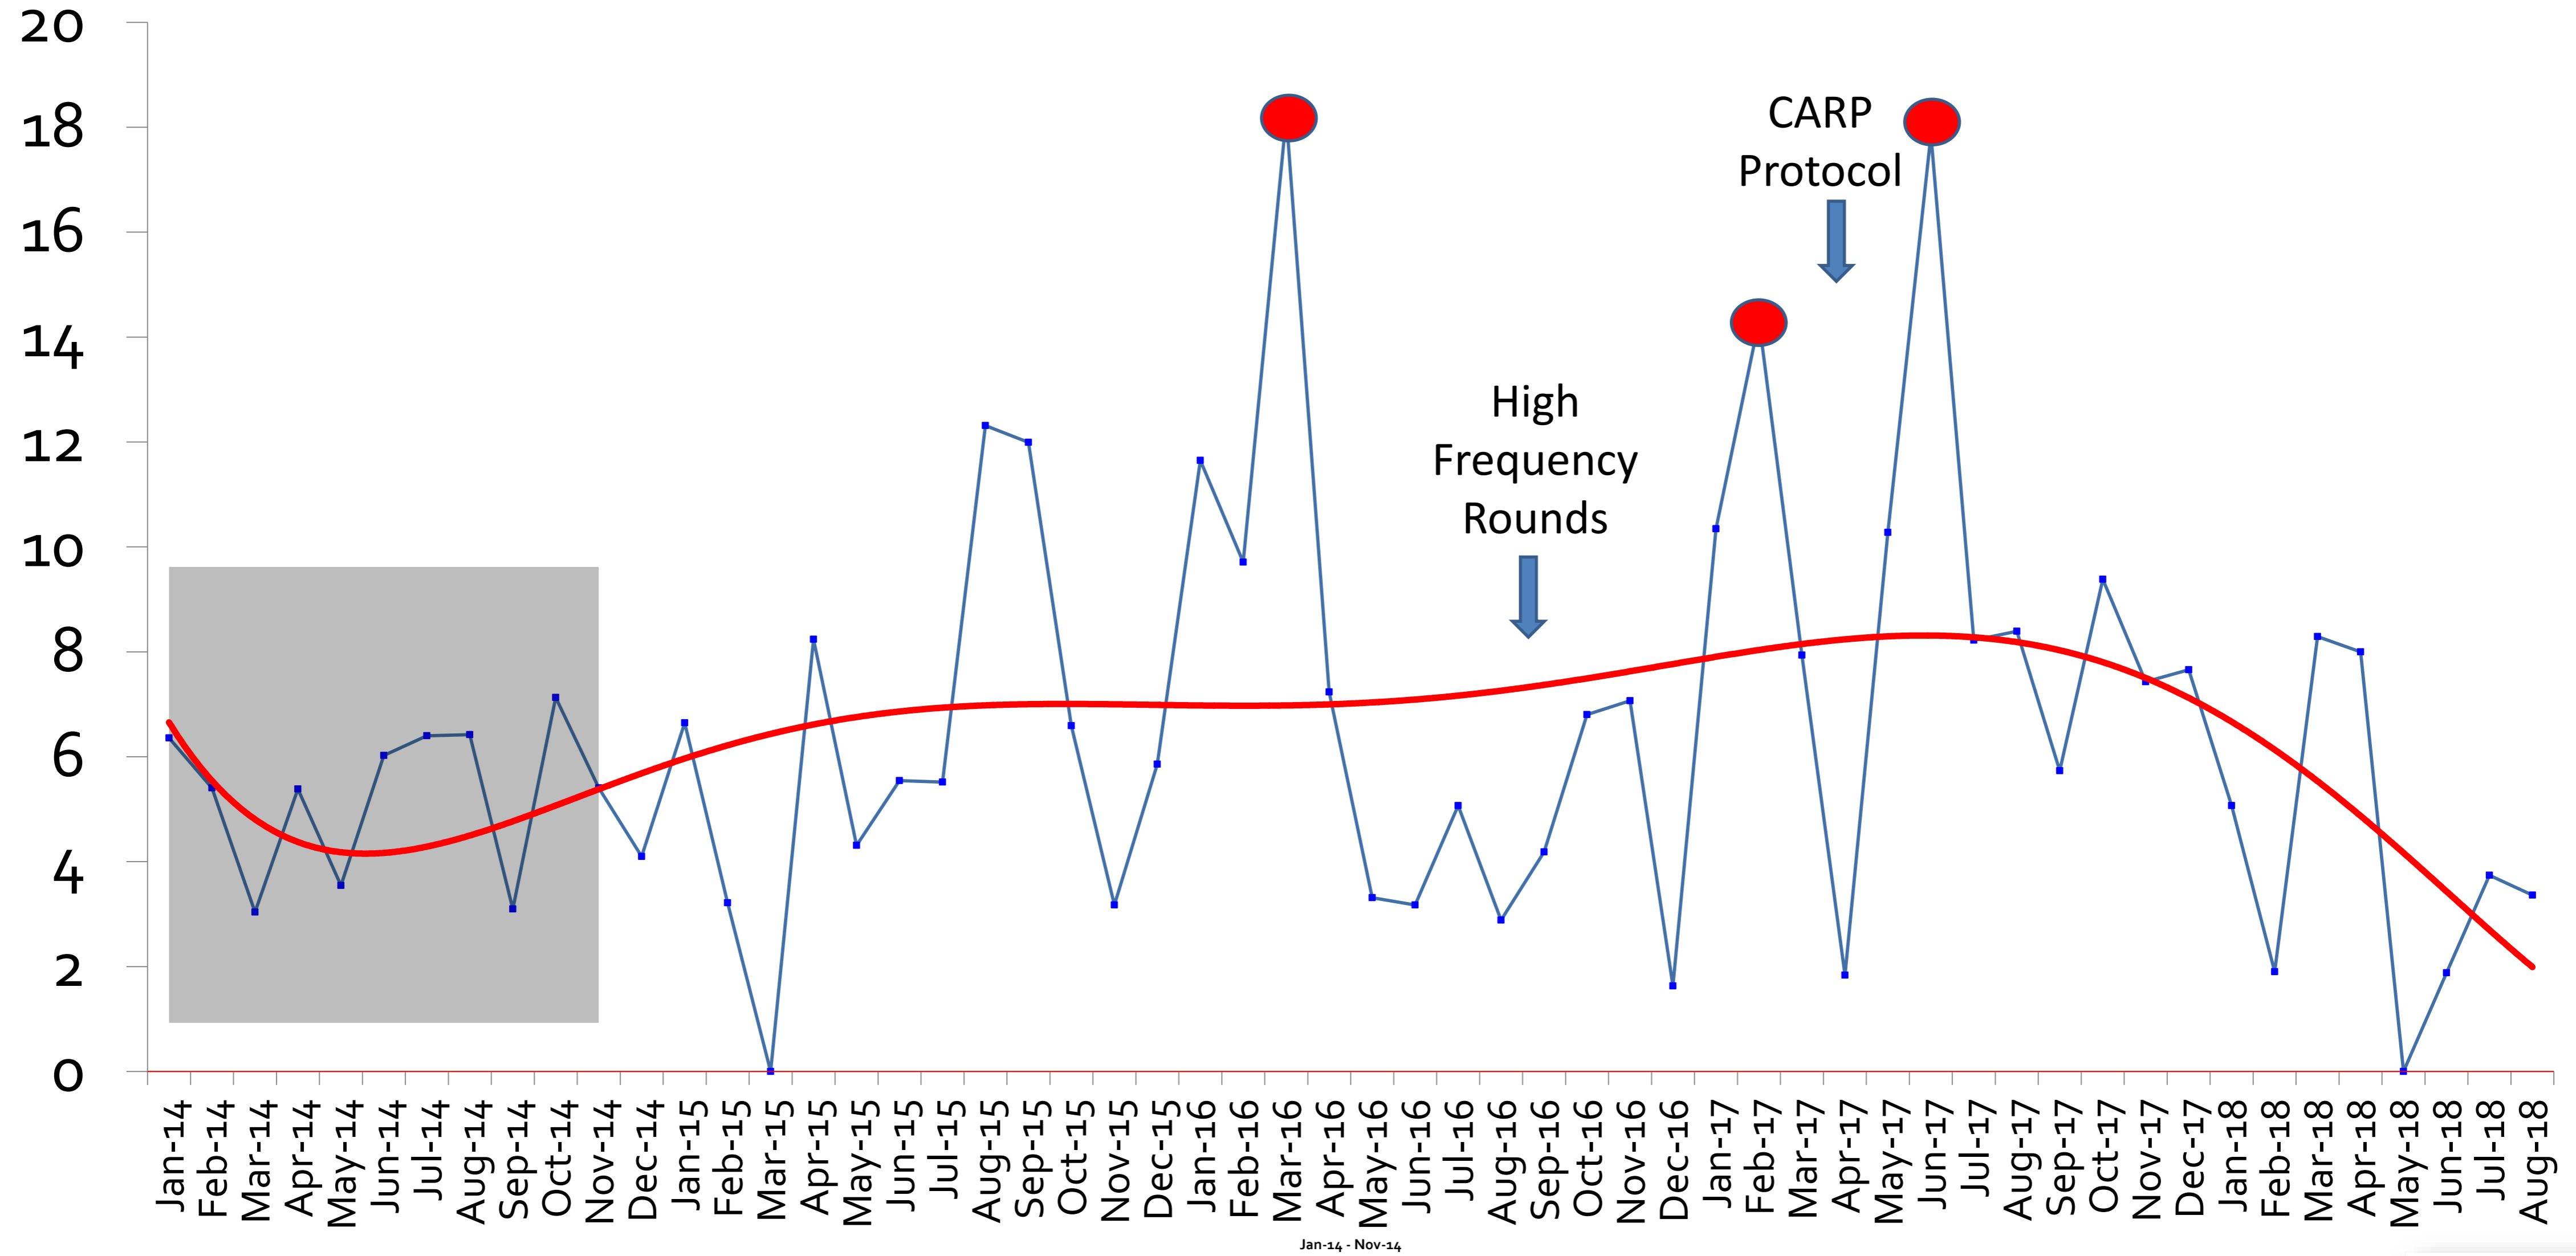

I know what is wrong:

I know what to worry about:

Preventative Measures	LIP: Goal/Alarm Parameters		
		AM	PM
<input checked="" type="checkbox"/> PRE-SEDATE with all noxious stimuli (e.g IV sticks, gastric tube placement, etc) <input checked="" type="checkbox"/> 24 hour EEG <input checked="" type="checkbox"/> No Bath, including CHG <input checked="" type="checkbox"/> No Weights <input checked="" type="checkbox"/> No linen changes <input checked="" type="checkbox"/> Pacemaker cables attached to patient wires, box at bedside <ul style="list-style-type: none"> o Settings: <ul style="list-style-type: none"> ▪ Mode: _____ ▪ Lower Rate: _____ <input checked="" type="checkbox"/> Initial suctioning ETT with LIP present <input checked="" type="checkbox"/> Subsequent suction plan: <ul style="list-style-type: none"> <input type="checkbox"/> Pre-sedate & paralyze <input type="checkbox"/> Pre-sedate only <input type="checkbox"/> LIP present <input type="checkbox"/> LIP notified <input checked="" type="checkbox"/> Standard (2-person present) 	HR		
	SBP		
	MAP		
	Sats		
	pH		
	RAP

CICU Adjusted Arrests per 1,000 Patient Days

Jan-14 - Nov-14

Critical Event Review

The Use of Video and “Debriefing” in the Cardiac ICU

“Instant Replay”

The World Cup and National Football League
“Gets It Right”

Healthcare: The Next Group for Body Cameras?

Video Debriefing in the Cardiac ICU

John T. Berger, MD

- 24 hour Video Recording of Each Room
- Stored for 24 hours
- More accurate and reliable understanding of the events
 - “Everything was fine until the patient arrested”
- Better learning and performance improvement
- Learning theory – Reflection on Action

Performance during PICU CPR Events (n=40)

CPR Target	Monitor / Defibrillator Data	Code Leader Recall
Inadequate Chest Compression (CC) Rate	7.5%	0%
Inadequate CC Depth	10%	0%
CPR interruption > 10 sec	80%	47%
Over-ventilation during CPR	71%	67%

You cannot correct what you cannot see

McInnes et al. Resuscitation 2012

8 year old with Severe Pulmonary Hypertension after Cardiac Catheterization

Nurse Called Physician:
“Patient Unresponsive”

8/23/2015 7:29:47 PM

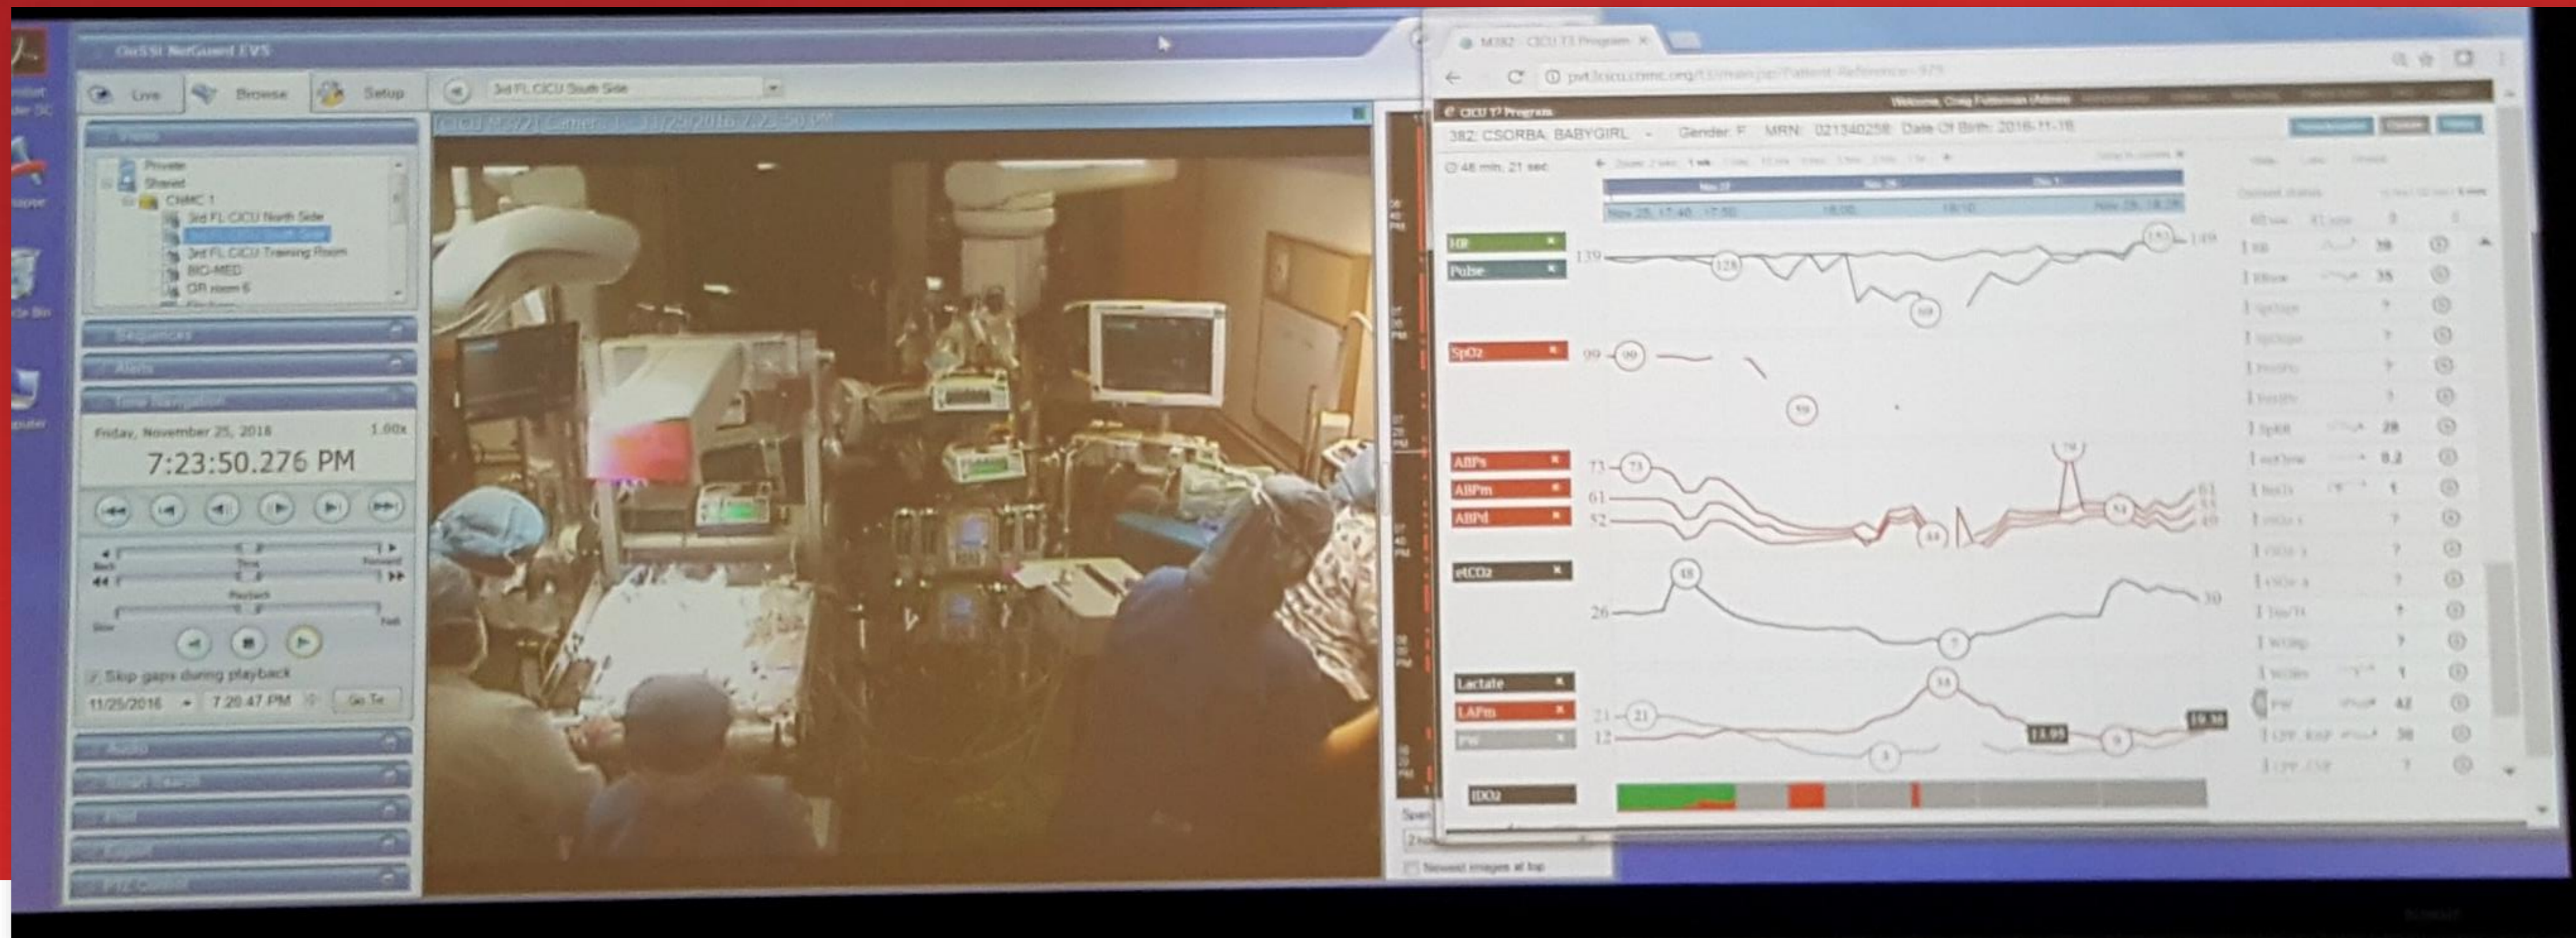

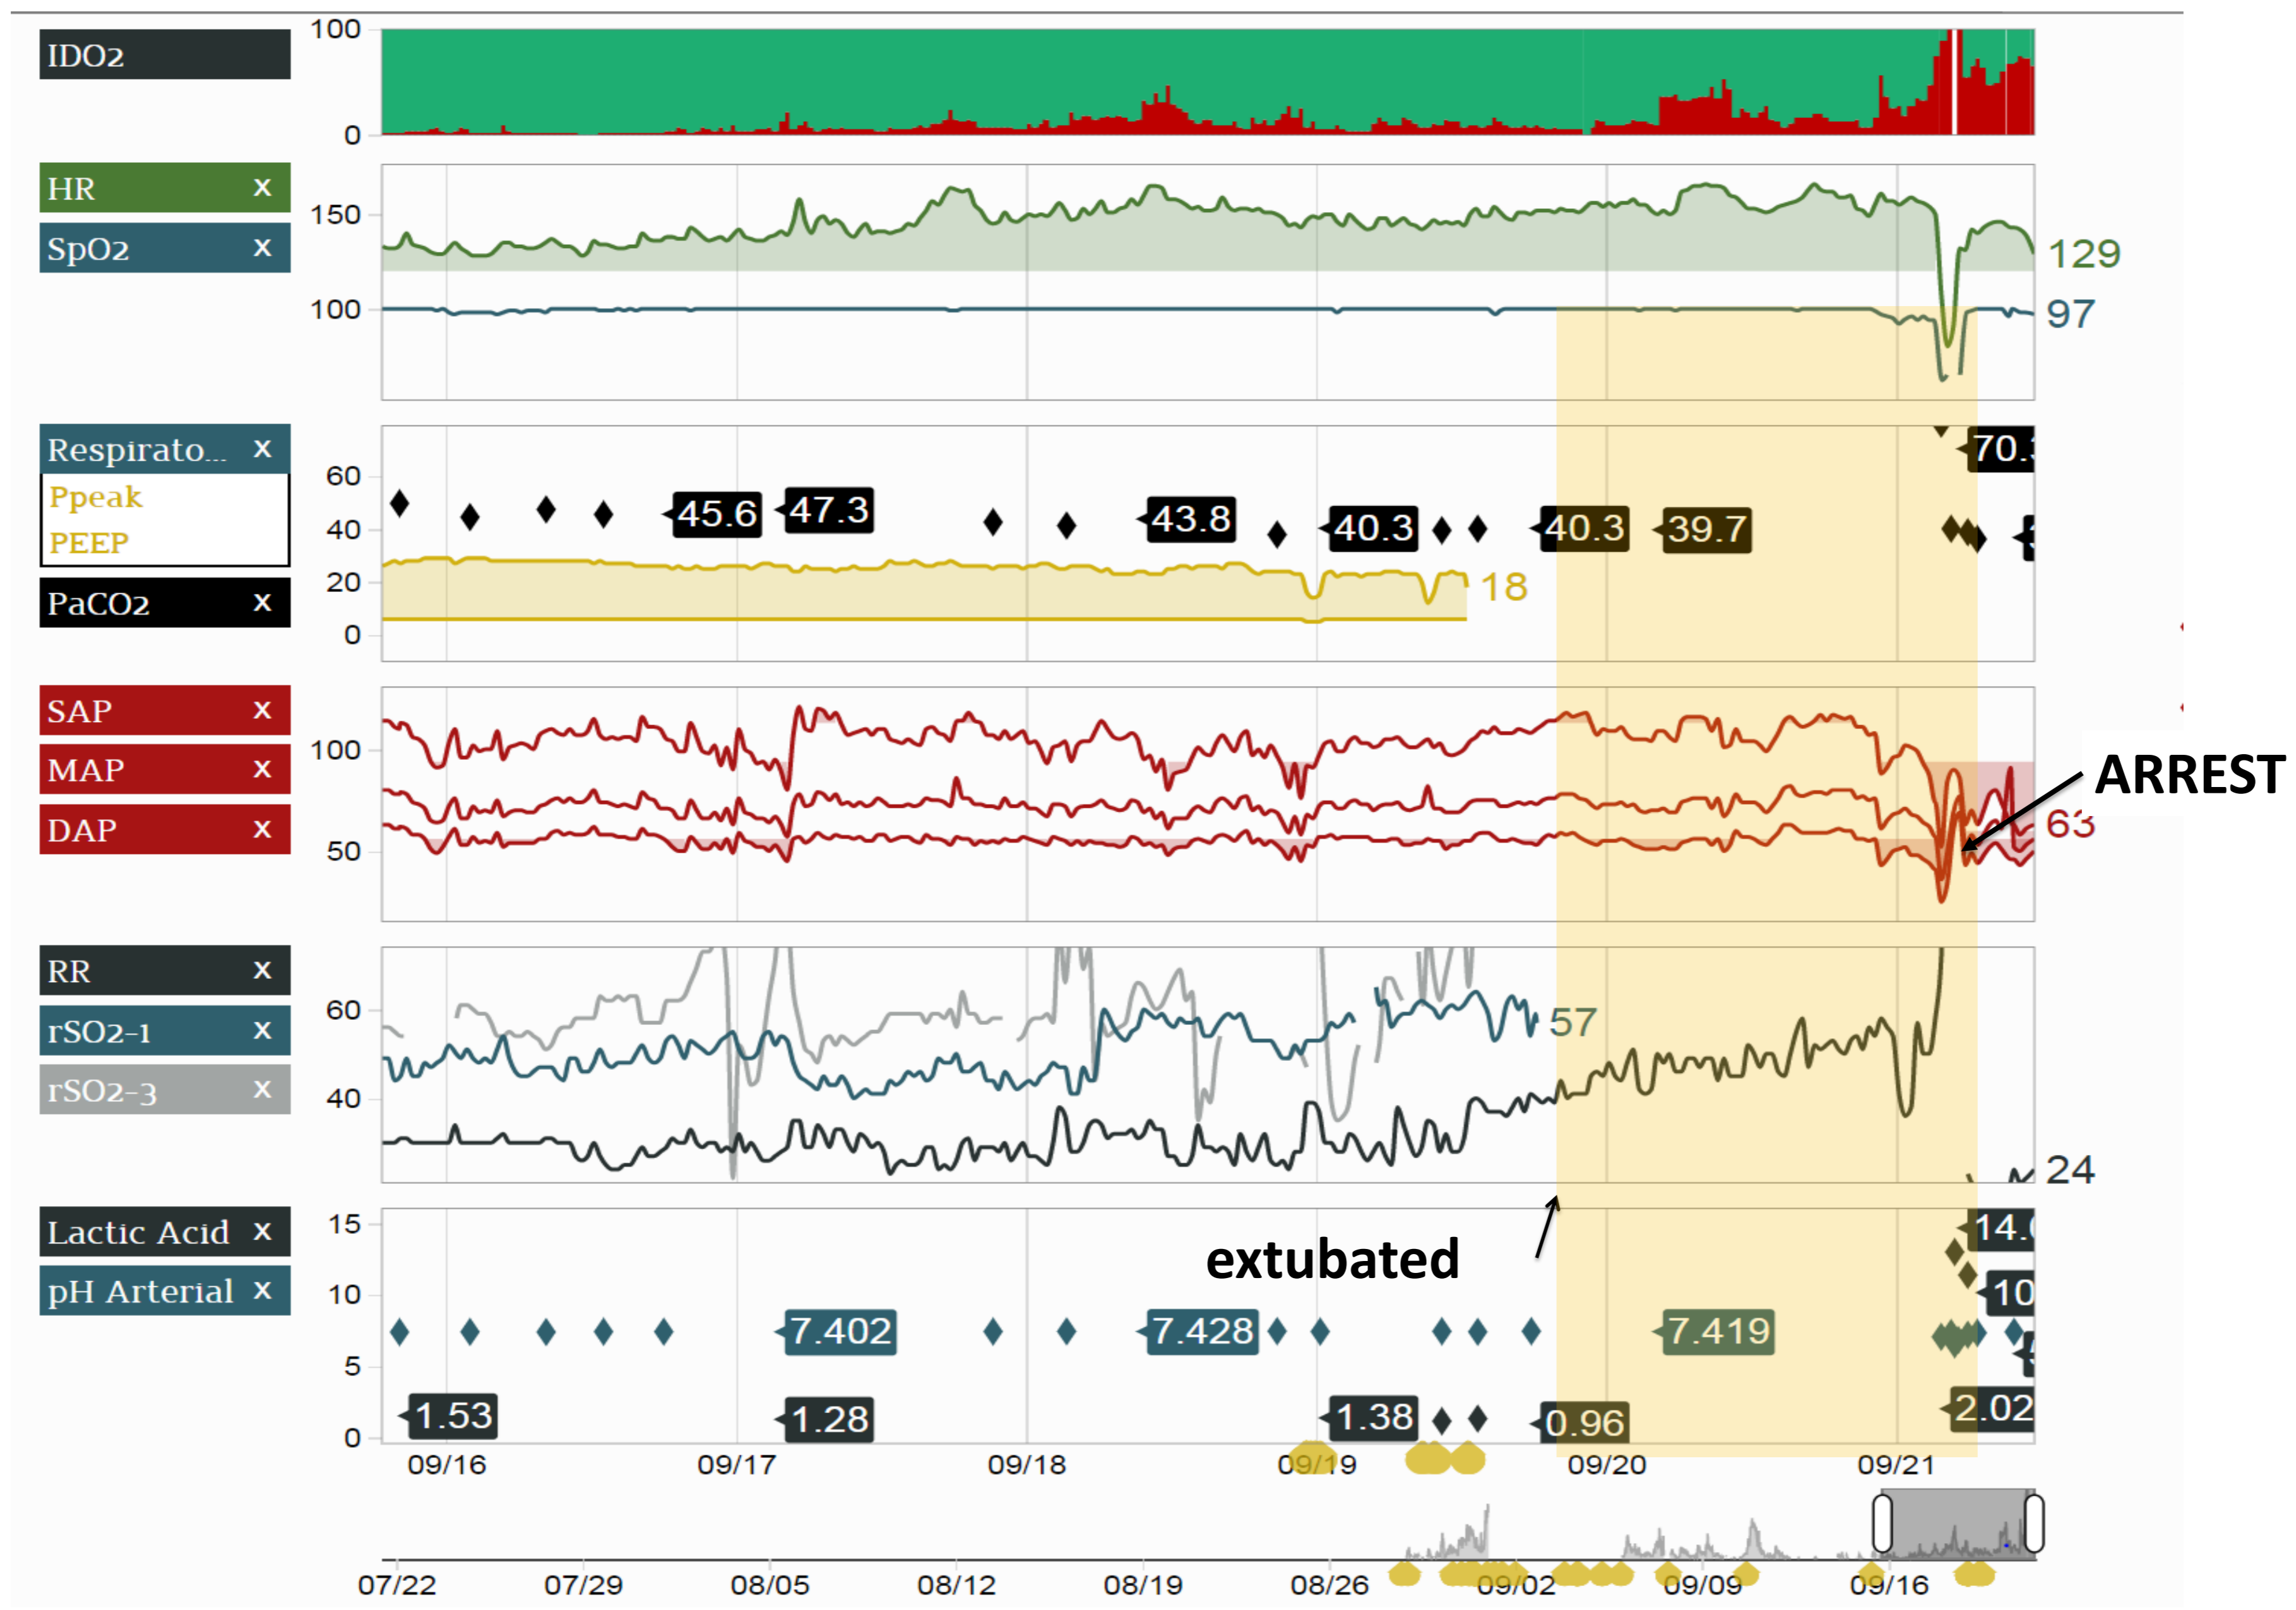

“INSTANT REPLAY”

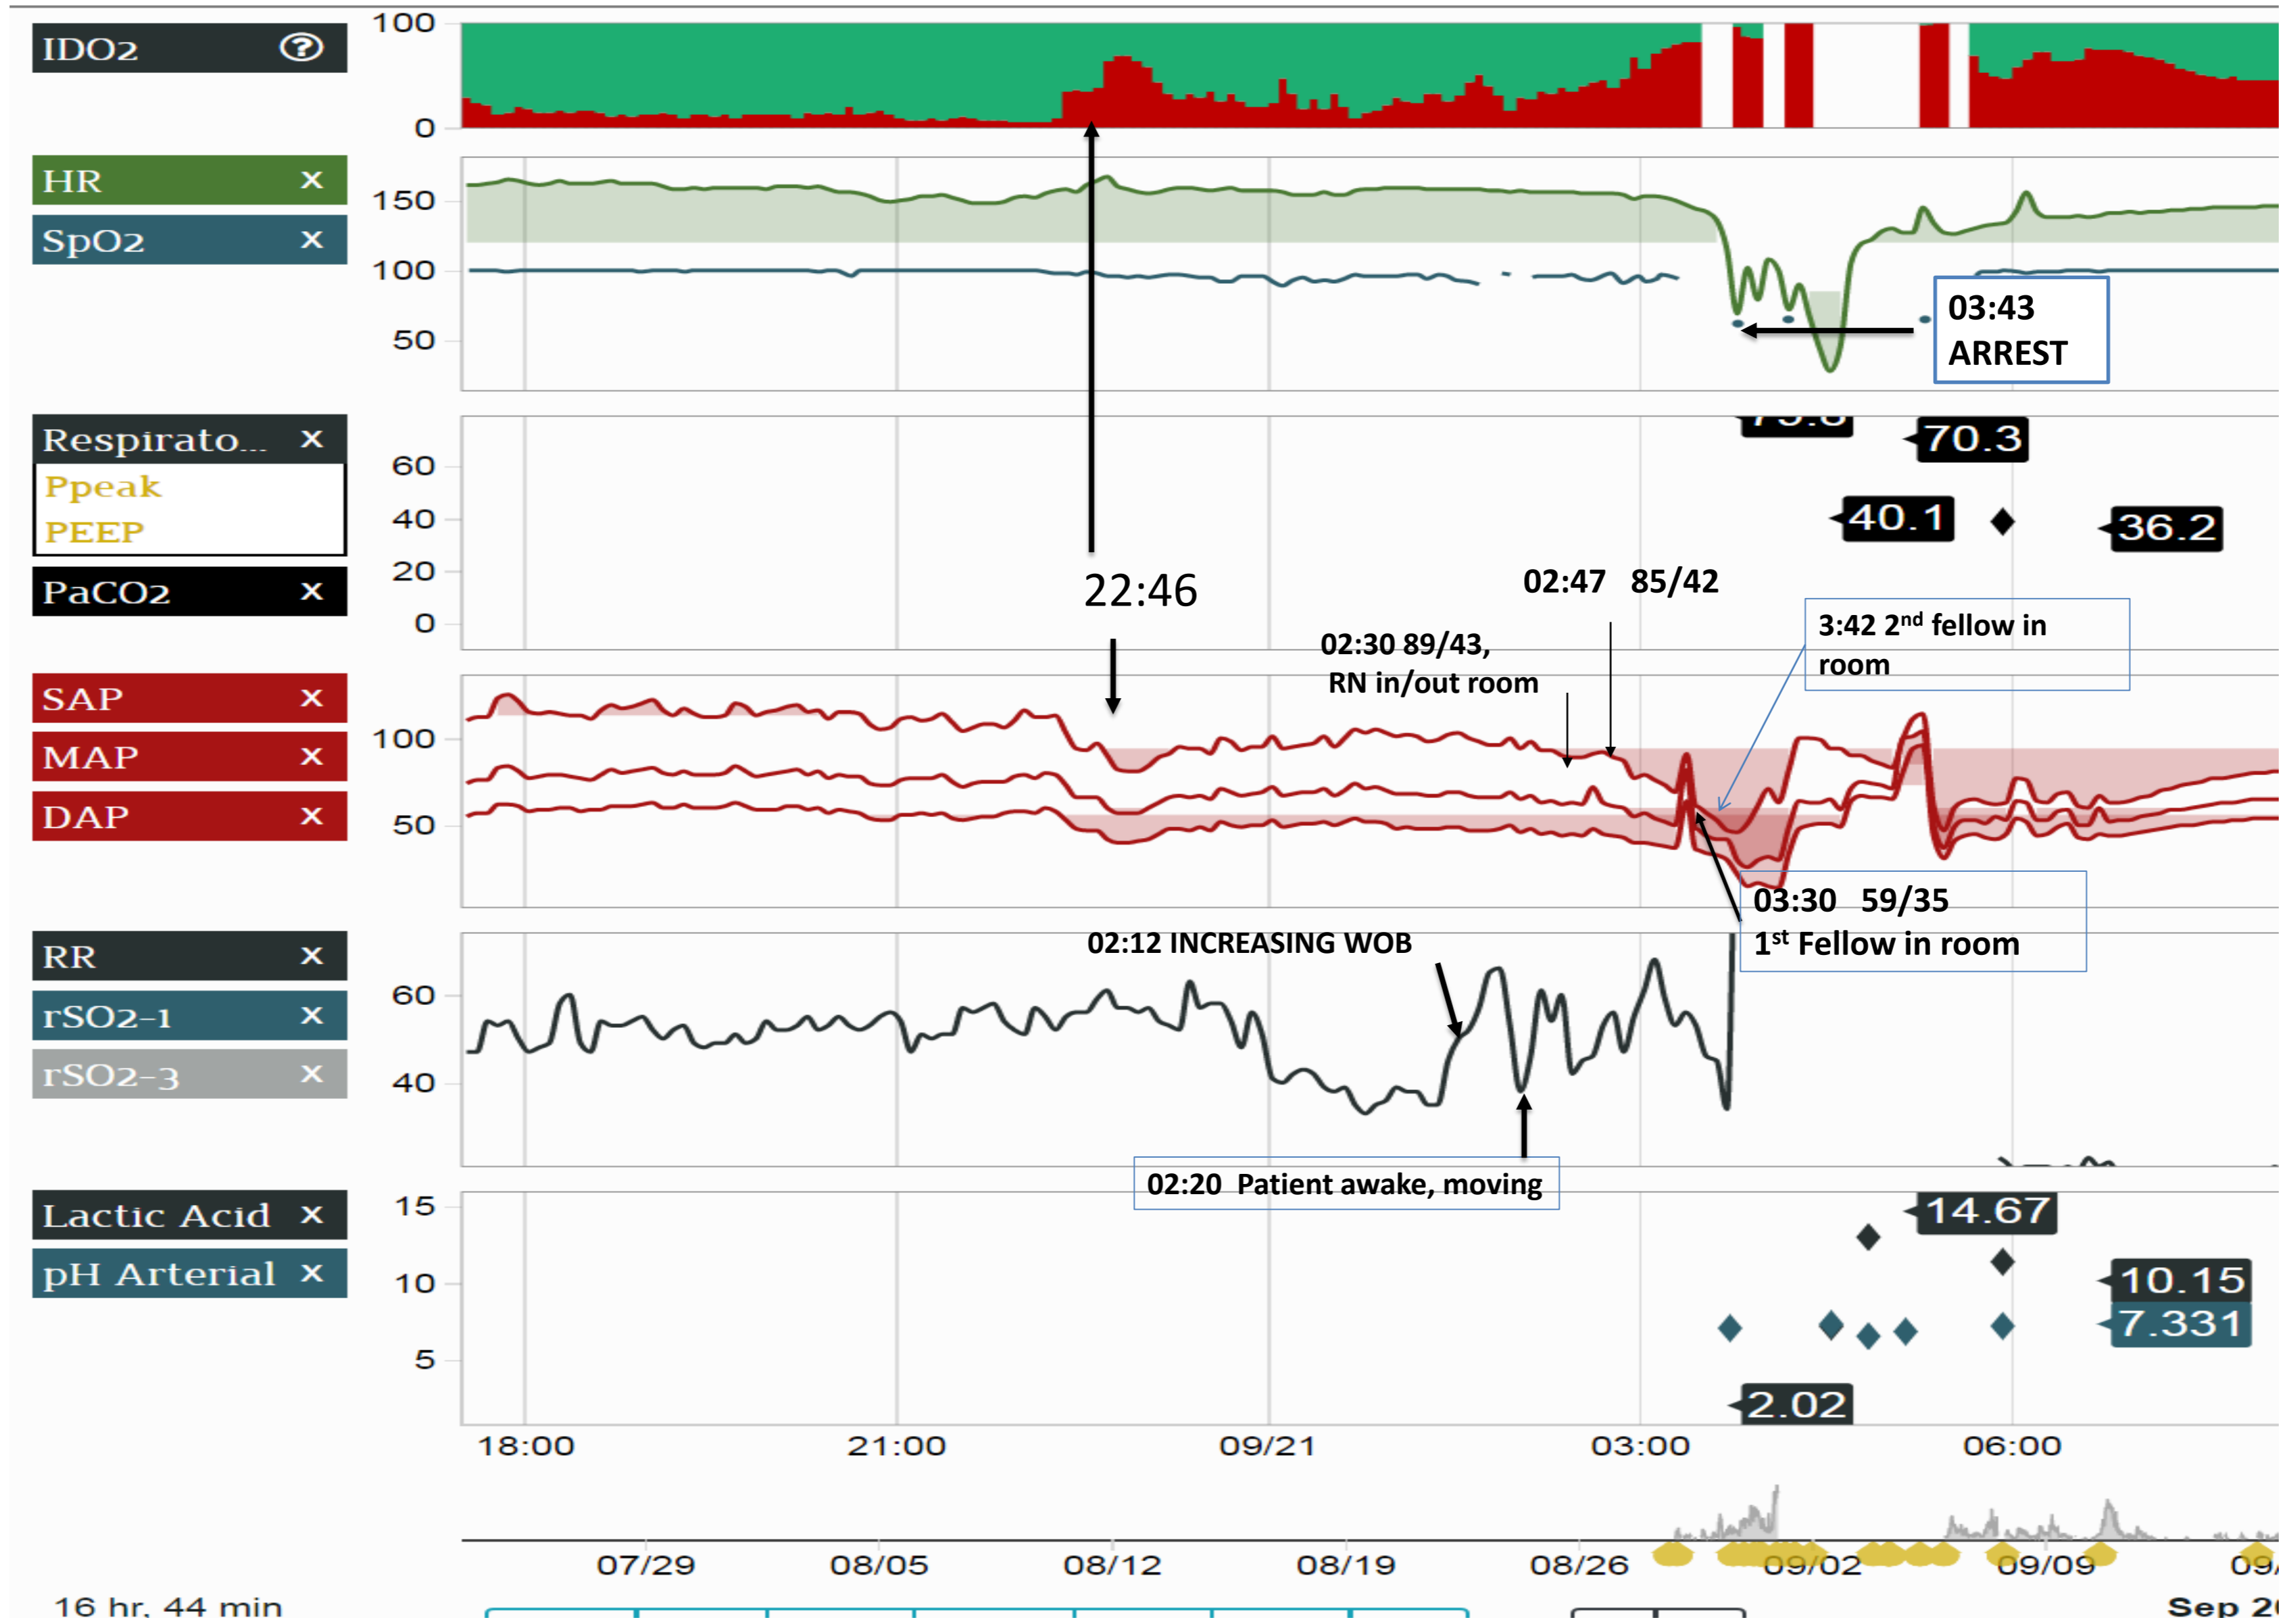

IMMEDIATELY AFTER PATIENT STABILIZATION:

- Physician In Charge of “Code”
 - All Other Personnel
 - Physicians, Nurses, Respiratory Therapy, Support Staff
1. Each team member first fills out **standardized form**:
 - **What went well? What did not go as well as it could/should have? How did I perform?**
 2. **Discussion**
 - Individuals – **self criticism**
 - Individuals – feedback to others – **not blaming**. “Constructive Criticism”
 - Team – Noise, assigned roles, etc.
 - “Systems” – Availability of medications, beepers, etc.
 3. **Final Opinions Shared with *Entire Staff* by Physician in Charge**

Monitor Integration

CICU - Remote Monitoring

CICU - Remote Monitoring

Alejandro Jose Lopez Magallon, MD
Ricardo Muñoz, MD

Paper → Electronic

Intermittent Monitoring → Continuous Monitoring

Isolated Monitoring → Integrated Monitoring

Memory of Events → Video Documentation of Events

New Thinking in Single Ventricle

Terminology

Management Philosophy

I Suspect This Will Be Controversial

gwernovsky@childrensnational.org

Concepts and Terminology That I

Suggest We *Eliminate*:

Parallel Circulation
“Overcirculation”

Balancing the Circulation

Optimal $Q_p:Q_s$ Ratio

Simplistic

Outdated

Non-Specific

Inaccurate

In Patients with a Single Ventricle

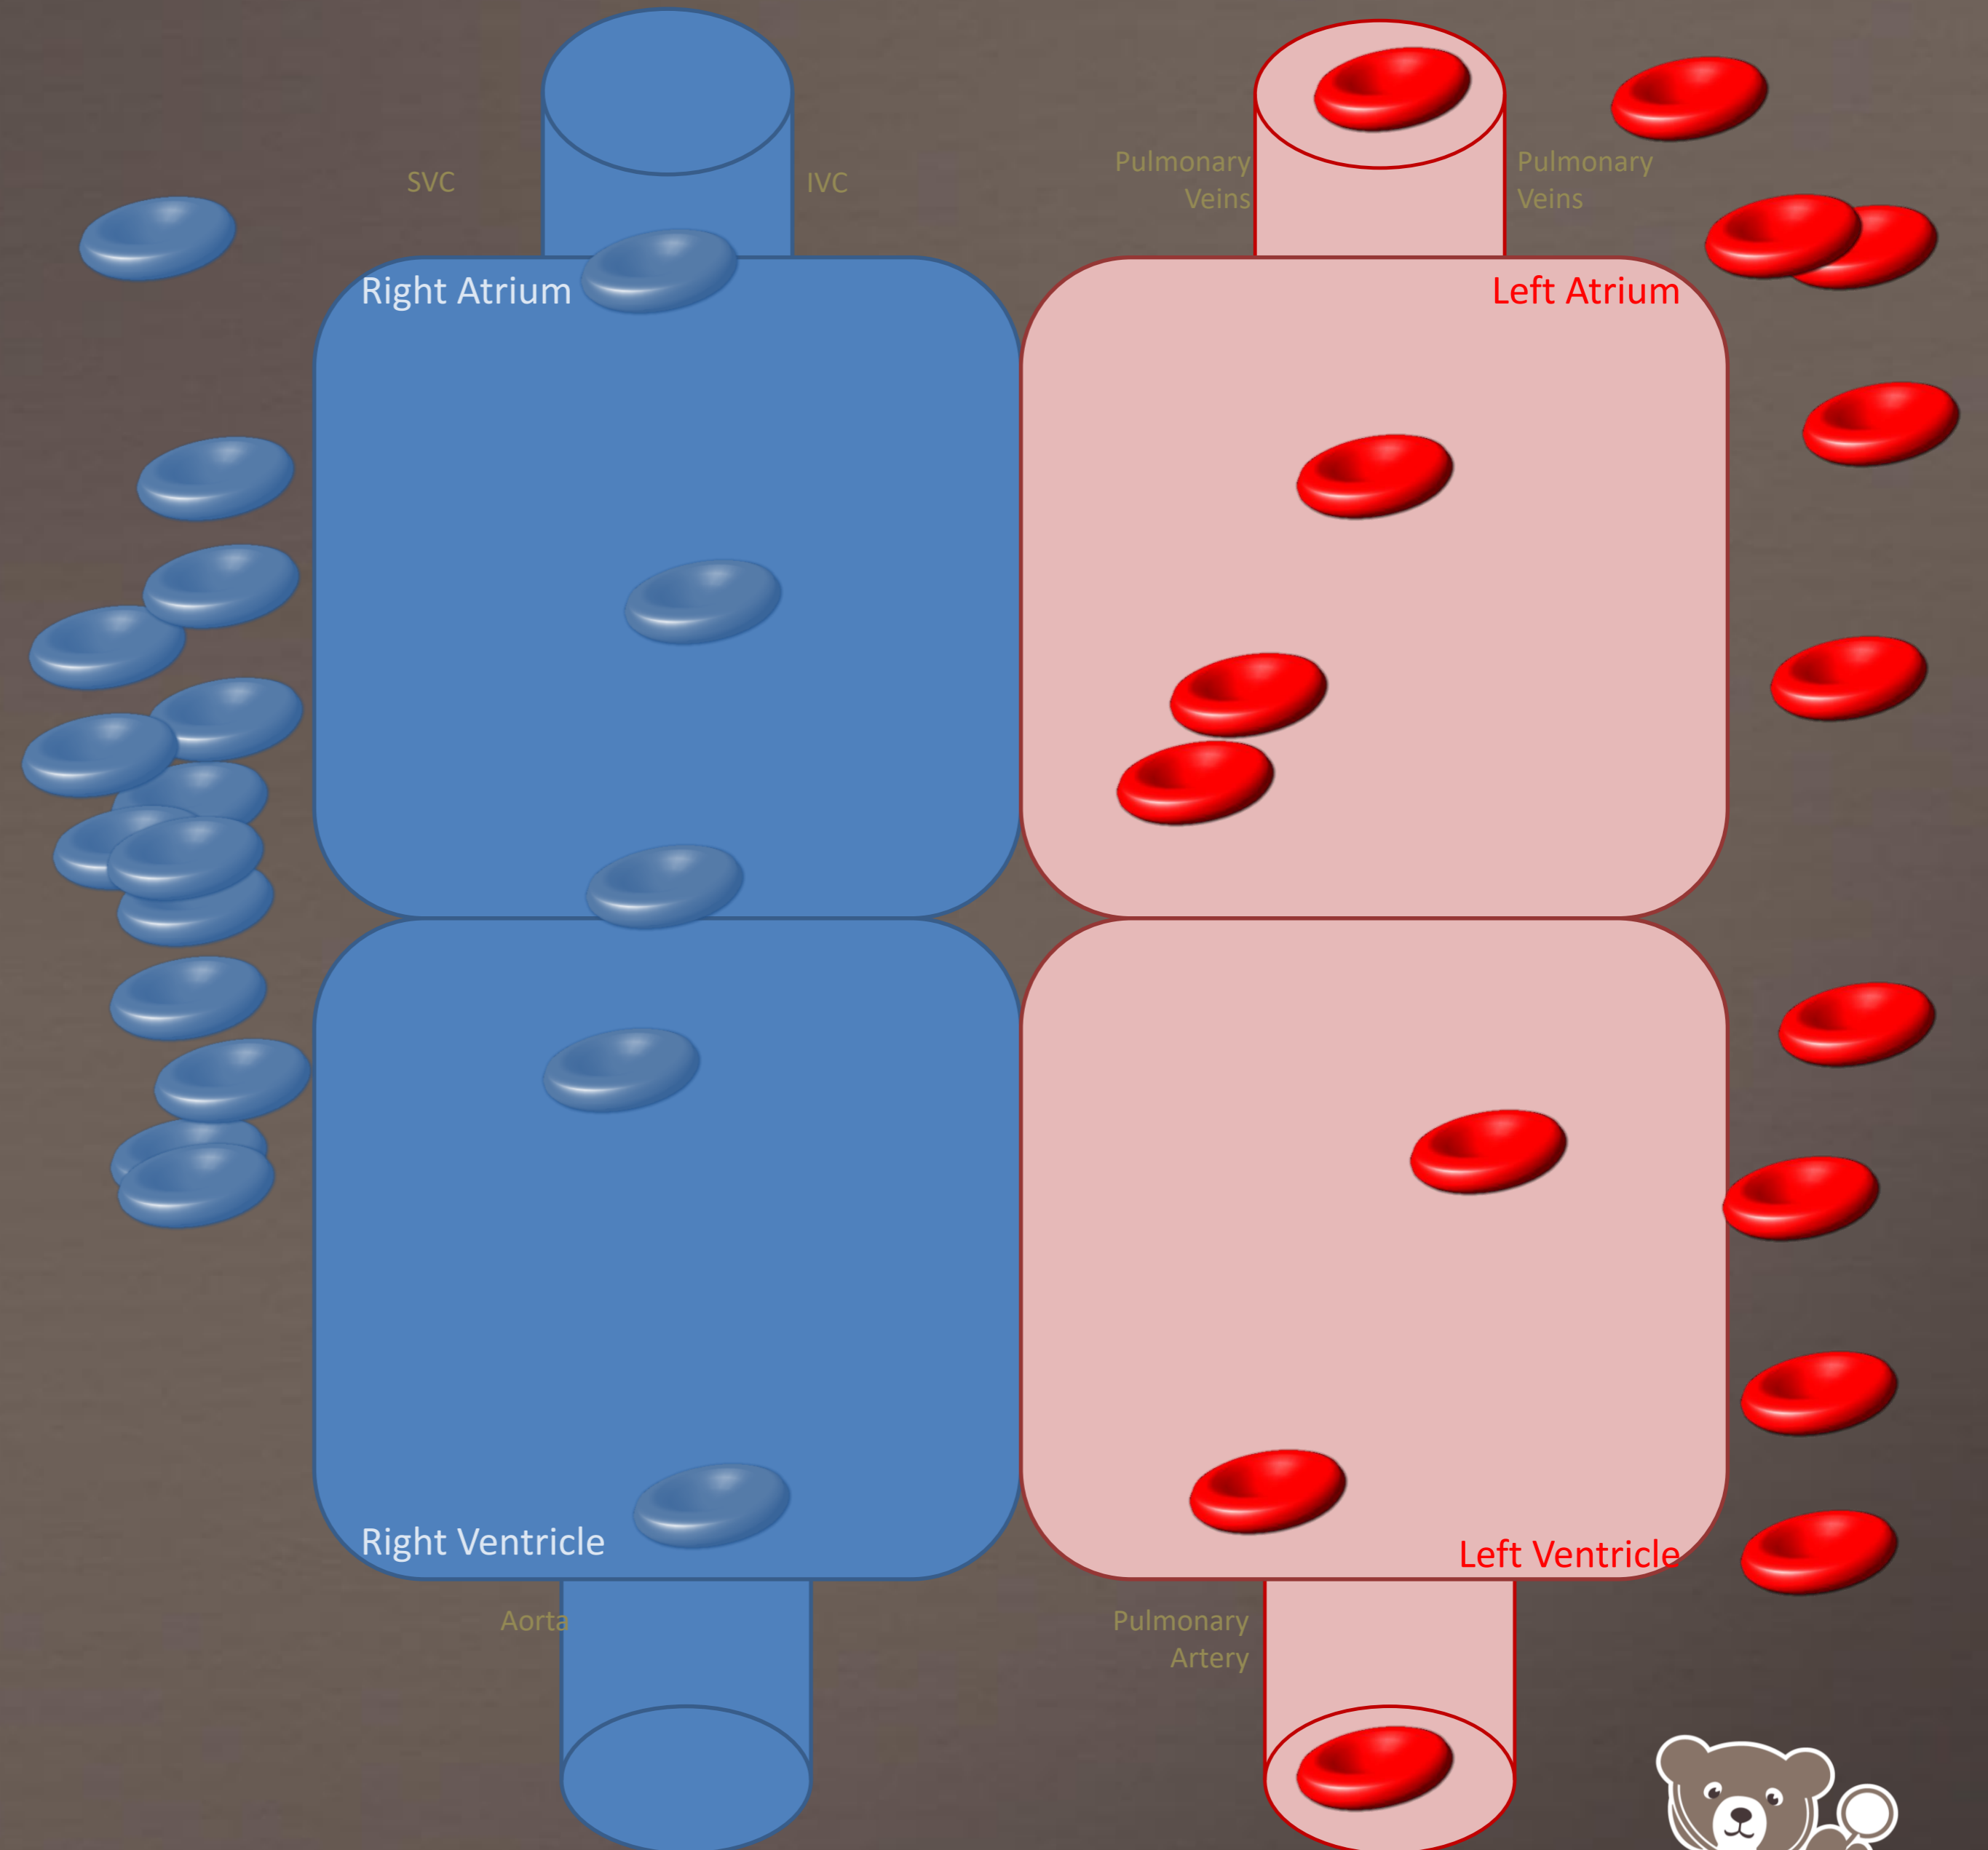

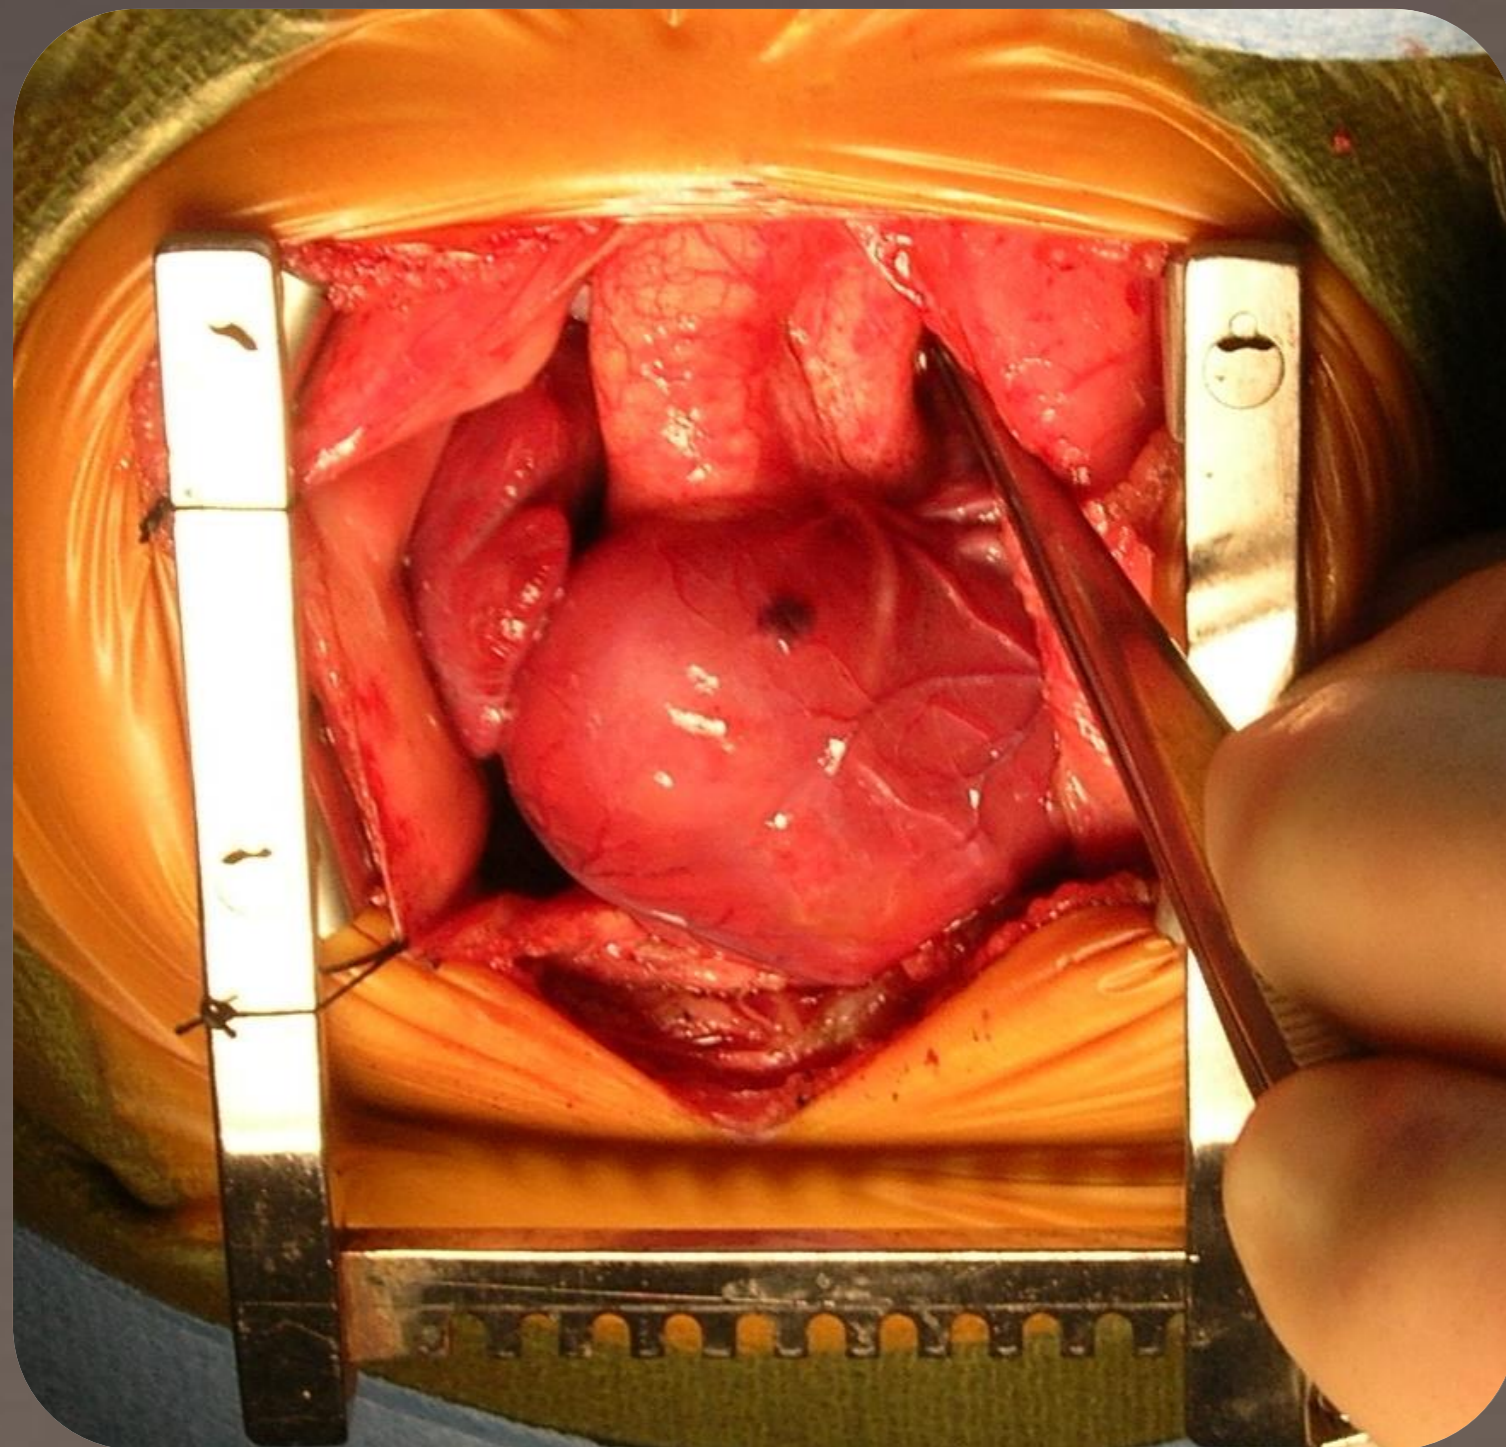

Concepts That I Suggest We *Eliminate*:

Parallel Circulation

“Parallel Circulation”

Should Be Reserved for
Transposition of the Great
Arteries

Single Ventricle Results in a “Multi-Distribution Circulation”

Qp

+Qs

+Qr

In Patients with a Single Ventricle

Concepts That I Suggest We *Eliminate*:

“Overcirculation”

©2018 Gil Wernovsky

Examples of “Overcirculation” or “High $Q_p:Q_s$ ”

Patent Ductus Arteriosus (PDA)

© 2015 Texas Children's Hospital

© 2012 Texas Children's Hospital

Rethinking Single Ventricle Management

- *In isolation*, pulmonary over-circulation DOESN'T matter
- Systemic under-circulation DOES matter
- Pulmonary under-circulation DOES matter

Preferred Terminology and Thinking

Hypoxemia and/or Low Systemic Oxygen Delivery (“Undercirculation”)

May Be Caused By:

1. Ventricular Dysfunction and/or
2. Circulatory Maldistribution due to:
 - Anatomic Obstruction
 - Preoperative – PDA, Atrial Septum, Ventricular to Systemic or Pulmonary Circuit
 - Postoperative – Arch, Atrial Septum, Shunt, Bands
 - Fluctuations in Pulmonary and Systemic Vascular Resistance
 - Atrio-Ventricular Valve Regurgitation
 - Anatomically Large Shunt (*in isolation-**RARE***)

In Patients with a Single Ventricle

Concepts That I Suggest We *Eliminate*:

“BALANCING THE CIRCULATION”

“Optimal $Q_p:Q_s$ Ratio”

“Ideal” Oxygen Saturation

Children's National™

HLHS: Pulse Oximetry Value of 90%

Pulse Oximetry Value of 90%

Pulmonary Vein	100
Pulse Oximetry	90

?? High Qp:Qs

Pulse Oximetry Value of 90%

Pulmonary Vein	100
Pulse Oximetry	90
Mixed Venous Saturation	70

Normal Oxygen Delivery!

No Medical Management Needed

Qp:Qs 2:1

(Needs Surgery)

“Balanced Circulation”

Qp:Qs 1:1

Pulmonary Vein	100
Pulse Oximetry	75
Mixed Venous Saturation	50

“Balanced Circulation”

Qp:Qs 1:1

Pulmonary Vein	100
Pulse Oximetry	75
Mixed Venous Saturation	50

Borderline Oxygen Delivery!
Medical Management Needed

(Needs Surgery)

“Ideal” Oxygen Saturation of 80%

Pulmonary Vein	100
Pulse Oximetry	80

“Ideal” Oxygen Saturation of 80% (Needs Surgery)

Pulmonary Vein	100
Pulse Oximetry	80
Mixed Venous Saturation	30

Very Low Oxygen
Delivery!

**Medical Management
Needed Quickly!**

Qp:Qs 2 ½:1

Principles of Care:

Maximize Systemic O_2 Delivery

Q_s

Blood O_2 Content

Regurgitant Fraction

AV Valve
Semilunar Valve

Ventricular Output

Q_p

PDA
Shunt
Band
PVR & SVR

Effective Oxygenation

Lung Disease
Pneumothorax
Pleural Effusion
Etc.

O_2 Carrying Capacity

Hg content
Hg function

Heart Rate

Endogenous
Paced

A-V Synchrony
Pacing Site

Stroke Volume

Afterload

PDA
Stent
Neo-Aortic Impedance
SVR

Contractility

Myocyte Function
Coronary Blood Flow
Pharmacological Support
Electrolyte Balance
Acid/Base Status

Preload

Pericardial fluid
Blood volume
CVP

Principles of Care:

Qs

=

*Maximize
Systemic O₂
Delivery*

Qp

Blood O₂
Content

**Does it Really Make
Sense to use a Ratio
Here????**

Effective
Oxygenation

Lung Disease
Pneumothorax
Pleural Effusion
Etc.

O₂ Carrying Capacity

Hg content
Hg function

PDA
Shunt
Band
PVR & SVR

Stroke
Volume

Contractility

Myocyte Function
Coronary Blood Flow
Pharmacological Support
Electrolyte Balance
Acid/Base Status

Preload

Pericardial fluid
Blood volume
CVP

Heart
Rate

A-V Synchrony
Pacing Site

Endogenous
Paced

Afterload

PDA
Stent
Neo-Aortic Impedance
SVR

New Thinking

- Target Oxygen Delivery, not Oxygen Saturation
 - A Patient with a “High” Oxygen Saturation (“Overcirculation”) May Not Be Sick
 - A Patient with a “Balanced Circulation” May Be Sick
 - A Patient with the “Ideal” Oxygen Saturation of 80% May Be Sick
- Don’t Treat Surgical Heart Disease with “Medical” Therapy

Summary

- What's New in Cardiac Intensive Care?
 - Not Much in New Medications or Procedures
 - *(Exception: Lymphatic Interventions)*
- Cardiac Arrest Reduction and Protocolized Management
- Critical Evaluations of Team Performance
- Integrated Monitoring & Remote Monitoring
- Revised Concepts in the Terminology, Assessment and Management of Single Ventricle
